Package 'httk'

July 23, 2025

Version 2.7.0 **Date** 2025-07-19

Title High-Throughput Toxicokinetics

Description Pre-made models that can be rapidly tailored to various chemicals and species using chemical-specific in vitro data and physiological information. These tools allow incorporation of chemical toxicokinetics (``TK") and in vitro-in vivo extrapolation (``IVIVE") into bioinformatics, as described by Pearce et al. (2017) (<doi:10.18637/jss.v079.i04>). Chemical-specific in vitro data characterizing toxicokinetics have been obtained from relatively high-throughput experiments. The chemical-independent (``generic") physiologically-based (``PBTK") and empirical (for example, one compartment) `TK" models included here can be parameterized with in vitro data or in silico predictions which are provided for thousands of chemicals, multiple exposure routes, and various species. High throughput toxicokinetics (``HTTK") is the combination of in vitro data and generic models. We establish the expected accuracy of HTTK for chemicals without in vivo data through statistical evaluation of HTTK predictions for chemicals where in vivo data do exist. The models are systems of ordinary differential equations that are developed in MCSim and solved using compiled (C-based) code for speed. A Monte Carlo sampler is included for simulating human biological variability (Ring et al., 2017 <doi:10.1016/j.envint.2017.06.004>) and propagating parameter uncertainty (Wambaugh et al., 2019 <doi:10.1093/toxsci/kfz205>). Empirically calibrated methods are included for predicting tissue:plasma partition coefficients and volume of distribution (Pearce et al., 2017 < doi:10.1007/s10928-017-9548-7>). These functions and data provide a set of tools for using IVIVE to convert concentrations from high-throughput screening experiments (for example, Tox21, ToxCast) to real-world exposures via reverse dosimetry (also known as ``RTK") (Wetmore et al., 2015 <doi:10.1093/toxsci/kfv171>).

add_chemtable

Add a table of chemical information for use in making httk predictions.

Description

This function adds chemical-specific information to the table chem.physical_and_invitro.data. This table is queried by the model parameterization functions when attempting to parameterize a model, so adding sufficient data to this table allows additional chemicals to be modeled.

8 add_chemtable

Usage

```
add_chemtable(
  new.table,
  data.list,
  current.table = NULL,
  reference = NULL,
  species = NULL,
  overwrite = FALSE,
  sig.fig = 4,
  clint.pvalue.overwrite = TRUE,
  allow.na = FALSE
)
```

Arguments

new.table Object of class data.frame containing one row per chemical, with each chemical

minimally described by a CAS number.

data.list This list identifies which properties are to be read from the table. Each item

in the list should point to a column in the table new.table. Valid names in the list are: 'Compound', 'CAS', 'DSSTox.GSID' 'SMILES.desalt', 'Reference', 'Species', 'MW', 'logP', 'pKa_Donor', 'pKa_Accept', 'logMA', 'Clint',

'Clint.pValue', 'Funbound.plasma', 'Fabs', 'Fgut', 'Rblood2plasma'.

current.table This is the table to which data are being added.

reference This is the reference for the data in the new table. This may be omitted if a

column in data.list gives the reference value for each chemical.

species This is the species for the data in the new table. This may be omitted if a column

in data.list gives the species value for each chemical or if the data are not species-

specific (e.g., MW).

overwrite If overwrite=TRUE then data in current.table will be replaced by any data in

new.table that is for the same chemical and property. If overwrite=FALSE (DE-FAULT) then new data for the same chemical and property are ignored. Funbound.plasma values of 0 (below limit of detection) are overwritten either way.

sig. fig Sets the number of significant figures stored (defaults to 4)

clint.pvalue.overwrite

If TRUE then the Cl_int p-value is set to NA when the Cl_int value is changed

unless a new p-value is provided. (defaults to TRUE)

allow.na If TRUE (default is FALSE) then NA values are written to the table, otherwise

they are ignored.

Value

data.frame A new data.frame containing the data in current.table augmented by new.table

Author(s)

John Wambaugh

add_chemtable 9

Examples

```
library(httk)
my.new.data <- as.data.frame(c("A","B","C"),stringsAsFactors=FALSE)</pre>

my.new.data$pka.b <- NA
# set chemical B to a base with multiple pka's (pKa_accept = 7 and 8):
```

10 age_draw_smooth

age_draw_smooth

Draws ages from a smoothed distribution for a given gender/race combination

Description

This function should usually not be called directly by the user. It is used by httkpop_generate() in "virtual-individuals" mode.

Usage

```
age_draw_smooth(gender, reth, nsamp, agelim_months, nhanes_mec_svy)
```

Arguments

gender Gender. Either 'Male' or 'Female'.

reth Race/ethnicity. One of 'Mexican American', 'Other Hispanic', 'Non-Hispanic

Black', 'Non-Hispanic White', 'Other'.

nsamp Number of ages to draw.

agelim_months Two-element numeric vector giving the minimum and maximum ages in months

to include.

nhanes_mec_svy surveydesign object created from mecdt using svydesign (this is done in

httkpop_generate)

Value

A named list with members 'ages_months' and 'ages_years', each numeric of length nsamp, giving the sampled ages in months and years.

```
apply_clint_adjustment
```

Correct the measured intrinsive hepatic clearance for fraction free

Description

This function uses the free fraction estimated from Kilford et al. (2008) to increase the in vitro measure intrinsic hepatic clearance. The assumption that chemical that is bound in vitro is not available to be metabolized and therefore the actual rate of clearance is actually faster. Note that in most high throughput TK models included in the package this increase is offset by the assumption of "restrictive clearance" – that is, the rate of hepatic metabolism is slowed to account for the free fraction of chemical in plasma. This adjustment was made starting in Wetmore et al. (2015) in order to better predict plasma concentrations.

Usage

```
apply_clint_adjustment(
   Clint,
   Fu_hep = NULL,
   Pow = NULL,
   pKa_Donor = NULL,
   pKa_Accept = NULL,
   suppress.messages = FALSE
)
```

Arguments

| Clint | In vitro measured | intrinsic he | patic clearance i | n units of | (ul/min/million hepato- | - |
|-------|-------------------|--------------|-------------------|------------|-------------------------|---|
| | | | | | | |

cytes).

Fu_hep Estimated fraction of chemical free for metabolism in the in vitro assay, esti-

mated by default from the method of Kilford et al. (2008) using calc_hep_fu

Pow The octanal:water equilibrium partition coefficient

pKa_Donor A string containing hydrogen donor ionization equilibria, concatenated with

commas. Can be "NA" if none exist.

pKa_Accept A string containing hydrogen acceptance ionization equilibria, concatenated

with commas. Can be "NA" if none exist.

suppress.messages

Whether or not the output message is suppressed.

Value

Intrinsic hepatic clearance increased to take into account binding in the in vitro assay

```

Description

This function uses the lipid binding correction estimated by Pearce et al. (2017) to decrease the fraction unbound in plasma (f_{up}). This correction assumes that there is additional in vivo binding to lipid, which has a greater impact on neutral lipophilic compounds.

Usage

```
apply_fup_adjustment(
  fup,
  fup.correction = NULL,
  Pow = NULL,
  pKa_Donor = NULL,
  pKa_Accept = NULL,
  suppress.messages = FALSE,
  minimum.Funbound.plasma = 1e-04
)
```

Arguments

fup In vitro measured fraction unbound in plasma

fup.correction Estimated correction to account for additional lipid binding in vivo (Pearce et

al., 2017) from calc_fup_correction

Pow The octanal:water equilibrium partition coefficient

pKa_Donor A string containing hydrogen donor ionization equilibria, concatenated with

commas. Can be "NA" if none exist.

13

```
pKa_Accept A string containing hydrogen acceptance ionization equilibria, concatenated with commas. Can be "NA" if none exist. suppress.messages Whether or not the output message is suppressed. minimum.Funbound.plasma f_{up} \text{ is not allowed to drop below this value (default is 0.0001)}.
```

Value

Fraction unbound in plasma adjusted to take into account binding in the in vitro assay

Author(s)

John Wambaugh

armitage_estimate_sarea
```

Estimate well surface area

Description

Estimate geometry surface area of plastic in well plate based on well plate format suggested values from Corning. option.plastic == TRUE (default) give nonzero surface area (sarea, m^2) option.bottom == TRUE (default) includes surface area of the bottom of the well in determining sarea. Optionally include user values for working volume (v_working, m^3) and surface area.

Usage

```
armitage_estimate_sarea(
  tcdata = NA,
  user_assay_parameters = NA,
  this.well_number = 384,
  this.cell_yield = NA,
  this.v_working = NA
)
```

Arguments

tcdata A data table with well_number corresponding to plate format, optionally include

v_working, sarea, option.bottom, and option.plastic OR with assay_component_endpoint_name

corresponding to an entry in invitro.assay.params.

user_assay_parameters

option to fill in your own assay parameters (data table)

this.well_number

For single value, plate format default is 384, used if is.na(tcdata)==TRUE

this.cell_yield

For single value, optionally supply cell_yield, otherwise estimated based on well

number

this.v_working For single value, optionally supply working volume, otherwise estimated based

on well number (m^3)

Value

A data table composed of any input data.table *tcdata* with only the following columns either created or altered by this function:

| Column Name | Description | Units |
|-------------|--------------------------------------|-------|
| well_number | number of wells on plate | |
| sarea | surface area | m^2 |
| cell_yield | number of cells | cells |
| v_working | working (filled) volume of each well | uL |
| v_total | total volume of each well | uL |

Description

Evaluate the Armitage model for chemical distribution *in vitro*. Takes input as data table or vectors of values. Outputs a data table. Updates over the model published in Armitage et al. (2014) include binding to plastic walls and lipid and protein compartments in cells.

Usage

```
armitage_eval(
  chem.cas = NULL,
  chem.name = NULL,

  surface.area.switch = TRUE
)
```

Arguments

chem.cas A single or vector of Chemical Abstracts Service Registry Number(s) (CAS-

RN) of desired chemical(s).

chem. name A single or vector of name(s)) of desired chemical(s).

dtxsid A single or vector of EPA's DSSTox Structure ID(s) (https://comptox.epa.

gov/dashboard)

casrn.vector A deprecated argument specifying a single or vector of Chemical Abstracts Ser-

vice Registry Number(s) (CAS-RN) of desired chemical(s).

nomconc.vector For vector or single value, micromolar (uM = mol/L) nominal concentration

(e.g. AC50 value)

this.well_number

For single value, plate format default is 384, used if is.na(tcdata)==TRUE. This value chooses default surface area settings for armitage_estimate_sarea based

on the number of wells per plate.

this.FBSf Fraction fetal bovine serum, must be entered by user.

tcdata A data.table with casrn, nomconc, MP, gkow, gkaw, gswat, sarea, v_total, v_working.

Otherwise supply single values to this.params (e.g., this.sarea, this.v_total, etc.). Chemical parameters are taken from chem.physical_and_invitro.data.

user_assay_parameters

option to fill in your own assay parameters (data table)

 $\begin{array}{ll} \mbox{this.sarea} & \mbox{Surface area per well (m^2)} \\ \mbox{this.v_total} & \mbox{Total volume per well (uL)} \\ \end{array}$

this.v_working Working volume per well (uL)

this.cell_yield

Number of cells per well

this.Tsys System temperature (degrees C)
this.Tref Reference temperature (degrees K)

this.option.kbsa2

Use alternative bovine-serum-albumin partitioning model

this.option.swat2

Use alternative water solubility correction

this.option.kpl2

Use alternative plastic-water partitioning model

this.option.bottom

Include the bottom of the well in surface area calculation

this.pseudooct Pseudo-octanol cell storage lipid content

this.memblip Membrane lipid content of cells this.nlom Structural protein content of cells

this.P_nlom Proportionality constant to octanol structural protein this.P_dom Proportionality constant to dissolve organic material this.P_cells Proportionality constant to octanol storage lipid

this.cell_pH 7.4, pH of cell this.Anionic_VF Anionic phospholipid fraction this.A_Prop_acid Sorption to anionic lipids - acidic chemicals this.A_Prop_base Sorption to anionic lipids - basic chemicals this.Lyso_VF lysosome volume fraction this.Lyso_Diam diameter of lysosome (500 nm) this.Lyso_pH pH of lysosome (5.1) this.csalt Ionic strength of buffer (M = mol/L)this.celldensity Cell density kg/L, g/mL this.cellmass Mass per cell, ng/cell this.f_oc Everything assumed to be like proteins this.conc_ser_alb Mass concentration of albumin in serum (g/L) this.conc_ser_lip Mass concentration of lipids in serum (g/L) 0 ml, the volume of dissolved organic matter (DOM) this.Vdom pH of cell culture this.pH restrict.ion.partitioning

> FALSE, Should we restrict the chemical available to partition to only the neutral fraction?

surface.area.switch

TRUE, automatically calculates surface area, switch to FALSE if user provided

Units character uM=umol/L unitless m^2 uL uL cells character log10 unitles log10 unitles log10 mg/L degrees Celc degrees Kelv g/mol

Value

| Param | Description |
|-------------------------------|---|
| casrn | Chemical Abstracts Service Registry Number |
| nomconc | Nominal Concentration |
| well_number | Number of wells in plate (used to set default surface area) |
| sarea | Surface area of well |
| v_total | Total volume of well |
| v_working | Filled volume of well |
| cell_yield | Number of cells |
| assay_component_endpoint_name | link to invitro.assay.params table |
| gkow | The log10 octanol to water (PC) (logP) |
| logHenry | The log10 Henry's law constant ' |
| gswat | The log10 water solubility (logWSol) |
| MP_C | The chemical compound melting point |
| MP_K | The chemical compound melting point |
| MW | The chemical compound molecular weight |

| gkaw | The air to water PC | unitless ratio |
|--------------|--|----------------|
| duow | internal energy of phase change for octanol-water | J/mol |
| duaw | internal energy of phase change for air-water | J/mol |
| gkmw | The log10 membrane to water PC | log10 unitles |
| gkcw | The log10 cell/tissue to water PC | log10 unitles |
| gkbsa | The log10 bovine serum albumin to water PC | log10 unitles |
| gkpl | The log10 plastic to water PC | log10 m2/m2 |

augment.table 21

Description

This internal function is used by add_chemtable to add a single new parameter to the table of chemical parameters. It should not be typically used from the command line.

Usage

```
augment.table(
  this.table,
  this.CAS,
  compound.name = NULL,
  this.property,
  value,
  species = NULL,
  reference,
  overwrite = FALSE,
  sig.fig = 4,
  clint.pvalue.overwrite = TRUE,
  allow.na = FALSE
)
```

Arguments

this.table Object of class data.frame containing one row per chemical.

this.CAS The Chemical Abstracts Service registry number (CAS-RN) correponding to the

parameter value

compound.name A name associated with the chemical (defaults to NULL)

this.property The property being added/modified.

value The value being assigned to this.property.

species This is the species for the data in the new table. This may be omitted if a column

in data.list gives the species value for each chemical or if the data are not species-

specific (e.g., MW).

reference This is the reference for the data in the new table. This may be omitted if a

column in data.list gives the reference value for each chemical.

overwrite If overwrite=TRUE then data in current.table will be replaced by any data in

new.table that is for the same chemical and property. If overwrite=FALSE (DE-FAULT) then new data for the same chemical and property are ignored. Funbound.plasma values of 0 (below limit of detection) are overwritten either way.

sig.fig Sets the number of significant figures stored (defaults to 4)

clint.pvalue.overwrite

If TRUE then the Cl_int p-value is set to NA when the Cl_int value is changed

unless a new p-value is provided. (defaults to TRUE)

allow.na If TRUE (default is FALSE) then NA values are written to the table, otherwise

they are ignored.

Value

data.frame A new data.frame containing the data in current.table augmented by new.table

John Wambaugh

```
available_rblood2plasma
```

Find the best available ratio of the blood to plasma concentration constant.

Description

This function finds the best available constant ratio of the blood concentration to the plasma concentration, using get_rblood2plasma and calc_rblood2plasma.

Usage

```
available_rblood2plasma(
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  species = "Human",
  adjusted.Funbound.plasma = TRUE,
  class.exclude = TRUE,
  suppress.messages = FALSE
)
```

Arguments

chem. cas Either the CAS number or the chemical name must be specified.

chem. name Either the chemical name or the CAS number must be specified.

dtxsid EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chemical must be identified by either CAS, name, or DTXSIDs

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

adjusted. Funbound. plasma
Whether or not to use Funbound. plasma adjustment if calculating Rblood2plasma.

class.exclude Exclude chemical classes identified as outside of domain of applicability by relevant modelinfo_[MODEL] file (default TRUE).

Whether or not to display relevant warning messages to user.

Details

suppress.messages

Either retrieves a measured blood:plasma concentration ratio from the chem.physical_and_invitro.data table or calculates it using the red blood cell partition coefficient predicted with Schmitt's method

If available, in vivo data (from chem.physical_and_invitro.data) for the given species is returned, substituting the human in vivo value when missing for other species. In the absence of

aylward2014 23

in vivo data, the value is calculated with calc_rblood2plasma for the given species. If Funbound.plasma is unvailable for the given species, the human Funbound.plasma is substituted. If none of these are available, the mean human Rblood2plasma from chem.physical_and_invitro.data is returned. details than the description above ~~

Value

The blood to plasma chemical concentration ratio - measured if available, calculated if not.

References

Aylward LL, Hays SM, Kirman CR, Marchitti SA, Kenneke JF, English C, Mattison DR, Becker RA (2014). "Relationships of chemical concentrations in maternal and cord blood: a review of available data." *Journal of Toxicology and Environmental Health, Part B*, **17**(3), 175–203. doi:10.1080/10937404.2014.884956.

benchmark_httk

Assess the current performance of httk relative to historical benchmarks

Description

The function performs a series of "sanity checks" and predictive performance benchmarks so that the impact of changes to the data, models, and implementation of the R package can be tested. Plots can be generated showing how the performance of the current version compares with past releases of httk.

Usage

```
benchmark_httk(
  basic.check = TRUE,
  calc_mc_css.check = TRUE,
  in_vivo_stats.check = TRUE,
  tissuepc.check = TRUE,
  suppress.messages = TRUE,
  make.plots = TRUE
)
```

Arguments

basic.check

Whether to run the basic checks, including uM and mg/L units for calc_analytic_css, calc_mc_css, and solve_pbtk as well as the number of chemicals with sufficient data to run the steady_state model (defaults to TRUE)

calc_mc_css.check

Whether to check the Monte Carlo sample. A comparison of the output of calc_mc_css to the SimCyp outputs reported in the Wetmore et al. (2012,2015) papers is performed. A comparison between the output of calc_analytic_css (no Monte Carlo) to the median of the output of calc_mc_css is also performed. (defaults to TRUE)

in_vivo_stats.check

Whether to compare the outputs of calc_mc_css and calc_tkstats to in vivo measurements of Css, AUC, and Cmax collected by Wambaugh et al. (2018). (defaults to TRUE)

tissuepc.check Whether to compare the tissue-specific partition coefficient predictions from the calibrated Schmitt (2008) model to the in vivo data-derived estimates compiled by Pearce et al. (2017). (defaults to TRUE)

benchmark_httk 25

suppress.messages

Whether or not output messages are suppressed (defaults to TRUE)

make.plots Whether current benchmarks should be plotted with historical performance (de-

faults to TRUE)

Details

Historically some refinements made to one aspect of httk have unintentionally impacted other aspects. Most notably errors have occasionally been introduced with respect to units (v1.9, v2.1.0). This benchmarking tool is intended to reduce the chance of these errors occurring in the future.

Past performance was retroactively evaluated by manually installing previous versions of the package from https://cran.r-project.org/src/contrib/Archive/httk/ and then adding the code for benchmark_httk at the command line interface.

The basic tests are important – if the output units for key functions are wrong, not much can be right. Past unit errors were linked to an incorrect unit conversions made within an individual function. Since the usage of convert_units became standard throughout httk, unit problems are hopefully less likely.

There are two Monte Carlo tests. One compares calc_mc_css 95th percentile steady-state plasma concentrations for a 1 mg/kg/day exposure against the Css values calculated by SimCyp and reported in Wetmore et al. (2012,2015). These have gradually diverged as the assumptions for httk have shifted to better describe non-pharmaceutical, commercial chemicals.

The in vivo tests are in some ways the most important, as they establish the overall predictability for httk for Cmax, AUC, and Css. The in vivo statistics are currently based on comparisons to the in vivo data compiled by Wambaugh et al. (2018). We see that when the tissue partition coefficient calibrations were introduced in v1.6 that the overall predictability for in vivo endpoints was reduced (increased RMSLE). If this phenomena continues as new in vivo evaluation data become available, we may need to revisit whether evaluation against experimentally-derived partition coefficients can actually be used for calibration, or just merely for establishing confidence intervals.

The partition coefficient tests provide an important check of the httk implementation of the Schmitt (2008) model for tissue:plasma equilibrium distribution. These predictions heavily rely on accurate description of tissue composition and the ability to predict the ionization state of the compounds being modeled.

Value

named list, whose elements depend on the selected checks

basic A list with four metrics: N.steadystate – Number of chemicals with sufficient data for steady-state IVIVE of calc_mc_css A list with four metrics: RMSLE.Wetmore – Root mean squared log10 error (RMSLE) in predicted Css because in_vivo_stats and units.plot A ggplot2 figure showing units tests of various functions. Output is generated for mg/L and uM, and then show model.rmsle.plot A ggplot2 figure comparing model predictions to in vivo measured values. Output generated is the root measured values predicted by other models (chiefly Sin A ggplot2 figure showing count of chemicals of various functions. Output generated is a count of the chemicals of various functions. Output generated is a count of the chemicals of various functions.

blood_mass_correct

Find average blood masses by age.

Description

If blood mass from blood_weight is negative or very small, then just default to the mean blood mass by age. (Geigy Scientific Tables, 7th ed.)

Usage

```
blood_mass_correct(blood_mass, age_months, age_years, gender, weight)
```

Arguments

blood_mass A vector of blood masses in kg to be replaced with averages.

age_months A vector of ages in months.

age_years A vector of ages in years.

gender A vector of genders (either 'Male' or 'Female').

weight A vector of body weights in kg.

Value

A vector of blood masses in kg.

Author(s)

Caroline Ring

blood_weight 27

Description

Predict blood mass based on body surface area and gender, using equations from Bosgra et al. 2012

Usage

```
blood_weight(BSA, gender)
```

Arguments

BSA Body surface area in m². May be a vector. gender Either 'Male' or 'Female'. May be a vector.

Value

A vector of blood masses in kg the same length as BSA and gender.

bmiage CDC BMI-for-age charts

Description

Charts giving the BMI-for-age percentiles for boys and girls ages 2-18

Usage

bmiage

28 body_surface_area

Format

A data.table with 434 rows and 5 variables:

Sex Female or Male

Agemos Age in months

P5 The 5th percentile BMI for the corresponding sex and age

P85 The 85th percentile BMI for the corresponding sex and age

P95 The 95th percentile BMI for the corresponding sex and age

Details

For children ages 2 to 18, weight class depends on the BMI-for-age percentile.

Underweight <5th percentile

Normal weight 5th-85th percentile

Overweight 85th-95th percentile

Obese >=95th percentile

body_surface_area

Predict body surface area.

Description

Predict body surface area from weight, height, and age, using Mosteller's formula for age>18 and Haycock's formula for age<18

Usage

```
body_surface_area(BW, H, age_years)
```

bone_mass_age 29

Arguments

BW A vector of body weights in kg.

H A vector of heights in cm.

age_years A vector of ages in years.

Value

A vector of body surface areas in cm².

Author(s)

Caroline Ring

bone_mass_age

Predict bone mass

Description

Predict bone mass from age_years, height, weight, gender, using logistic equations fit to data from Baxter-Jones et al. 2011, or for infants < 1 year, using equation from Koo et al. 2000 (See Price et al. 2003)

Usage

```
bone_mass_age(age_years, age_months, height, weight, gender)
```

Arguments

age_years Vector of ages in years.
age_months Vector of ages in months.
height Vector of heights in cm.

weight Vector of body weights in kg.

gender Vector of genders, either 'Male' or 'Female'.

30 brain_mass

Value

Vector of bone masses.

brain_mass

Predict brain mass.

Description

Predict brain mass from gender and age.

Usage

```
brain_mass(gender, age_years)
```

Arguments

gender Vector of genders, either 'Male' or 'Female'

age_years Vector of ages in years.

Value

A vector of brain masses in kg.

calc_analytic_css

Calculate the analytic steady state plasma concentration.

Description

This function calculates the analytic steady state plasma or venous blood concentrations as a result of infusion dosing for the three compartment and multiple compartment PBTK models.

Usage

```
calc_analytic_css(
  chem.name = NULL,
  chem.cas = NULL,
 dtxsid = NULL,
 parameters = NULL,
  species = "human",
 daily.dose = NULL,
 dose = 1,
  dose.units = "mg/kg/day",
  route = "oral",
 output.units = "uM",
 model = "pbtk",
  concentration = "plasma",
  suppress.messages = FALSE,
  tissue = NULL,
 bioactive.free.invivo = FALSE,
  IVIVE = NULL,
 parameterize.args.list = list(),
)
```

Arguments

| chem.name | Either the chemical name, CAS number, or the parameters must be specified. |
|------------|---|
| chem.cas | Either the chemical name, CAS number, or the parameters must be specified. |
| dtxsid | EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chemical must be identified by either CAS, name, or DTXSIDs |
| parameters | Chemical parameters from parameterize_pbtk (for model = 'pbtk'), parameterize_3comp (for model = '3compartment), parameterize_1comp(for model = '1compartment') or parameterize_steadystate (for model = '3compartmentss'), overrides chem.name and chem.cas. |
| species | Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human"). |
| daily.dose | Total daily dose, mg/kg BW. |
| dose | The amount of chemial to which the individual is exposed. |
| dose.units | The units associated with the dose received. |

route Route of exposure (either "oral", "iv", or "inhalation" default "oral").

output.units Units for returned concentrations, defaults to uM (specify units = "uM") but can

also be mg/L.

model Model used in calculation, 'gas_pbtk' for the gas pbtk model, 'pbtk' for the multiple compartment model, '3compartment' for the three compartment model,

'3compartmentss' for the three compartment steady state model, and '1com-

partment' for one compartment model.

concentration Desired concentration type: 'blood', 'tissue', or default 'plasma'. In the case that

the concentration is for plasma, selecting "blood" will use the blood:plasma ratio to estimate blood concentration. In the case that the argument 'tissue' specifies a particular tissue of the body, concentration defaults to 'tissue' – that is, the concentration in the If cocentration is set to 'blood' or 'plasma' and 'tissue' specifies a specific tissue then the value returned is for the plasma or blood in

that specific tissue.

suppress.messages

Whether or not the output message is suppressed.

tissue Desired steady state tissue concentration. Default is of NULL typically gives

whole body plasma concentration.

bioactive.free.invivo

If FALSE (default), then the total concentration is treated as bioactive in vivo. If TRUE, the the unbound (free) plasma concentration is treated as bioactive in

vivo. Only works with tissue = NULL in current implementation.

IVIVE Honda et al. (2019) identified four plausible sets of assumptions for in vitro-

in vivo extrapolation (IVIVE) assumptions. Argument may be set to "Honda1" through "Honda4". If used, this function overwrites the tissue, restrictive.clearance, and bioactive.free.invivo arguments. See Details below for more information.

parameterize.args.list

List of arguments passed to model's associated parameterization function, including default.to.human, adjusted.Funbound.plasma, regression, and minimum.Funbound.plasma.

The default.to.human argument substitutes missing animal values with human values if true, adjusted.Funbound.plasma returns adjusted Funbound.plasma when set to TRUE along with parition coefficients calculated with this value, regression indicates whether or not to use the regressions in calculating partition coefficients, and minimum.Funbound.plasma is the value to which Monte Carlo draws less than this value are set (default is 0.0001 - half the lowest measured

Fup in our dataset).

Additional parameters passed to parameterize function if parameters is NULL.

parameterize.args

Additional parameters passed to parameterize function if parameters is NULL.

Details

Concentrations are calculated for the specifed model with constant oral infusion dosing. All tissues other than gut, liver, and lung are the product of the steady state plasma concentration and the tissue to plasma partition coefficient.

Only four sets of IVIVE assumptions that performed well in Honda et al. (2019) are currently included in honda.ivive: "Honda1" through "Honda4". The use of max (peak) concentration can not be currently be calculated with calc_analytic_css. The httk default settings correspond to "Honda3":

| | In Vivo Conc. | Metabolic Clearance | Bioactive Chemical Conc. In Vivo | TK Statistic Used* |
|--------|------------------|---------------------|----------------------------------|--------------------|
| Honda1 | Veinous (Plasma) | Restrictive | Free | Mean Conc. In Vivo |
| Honda2 | Veinous | Restrictive | Free | Mean Conc. In Vivo |
| Honda3 | Veinous | Restrictive | Total | Mean Conc. In Vivo |
| Honda4 | Target Tissue | Non-restrictive | Total | Mean Conc. In Vivo |

Bioactive

"Honda1" uses plasma concentration, restrictive clearance, and treats the unbound invivo concentration as bioactive. For IVIVE, any input nominal concentration in vitro should be converted to cfree.invitro using armitage_eval, otherwise performance will be the same as "Honda2".

Value

Steady state plasma concentration in specified units

Author(s)

calc_analytic_css_1comp

Calculate the analytic steady state concentration for the one compartment model.

Description

This function calculates the analytic steady state plasma or venous blood concentrations as a result of infusion dosing.

Usage

```
calc_analytic_css_1comp(
  chem.name = NULL,
  chem.cas = NULL,
  dtxsid = NULL,
  species = "Human",
  parameters = NULL,
  dosing = list(daily.dose = 1),
  hourly.dose = NULL,
  dose.units = "mg",
  concentration = "plasma",
  suppress.messages = FALSE,
  recalc.blood2plasma = FALSE,
  tissue = NULL,
  restrictive.clearance = TRUE,
  bioactive.free.invivo = FALSE,
  Caco2.options = list(),
)
```

Arguments

chem.name

Either the chemical name, CAS number, or the parameters must be specified.

chem. cas Either the chemical name, CAS number, or the parameters must be specified.

dtxsid EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chem-

ical must be identified by either CAS, name, or DTXSIDs

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

parameters Chemical parameters from parameterize_pbtk (for model = 'pbtk'), parame-

terize_3comp (for model = '3compartment), parameterize_1comp(for model = '1compartment') or parameterize_steadystate (for model = '3compartmentss'),

overrides chem.name and chem.cas.

dosing List of dosing metrics used in simulation, which includes the namesake en-

tries of a model's associated dosing.params. For steady-state calculations this is likely to be either "daily.dose" for oral exposures or "Cinhaled" for inhalation.

hourly.dose Hourly dose rate mg/kg BW/h.

dose.units The units associated with the dose received.

concentration Desired concentration type, 'blood' or default 'plasma'.

suppress.messages

Whether or not the output message is suppressed.

recalc.blood2plasma

Recalculates the ratio of the amount of chemical in the blood to plasma using the input parameters. Use this if you have altered hematocrit, Funbound.plasma,

or Krbc2pu.

tissue Desired tissue conentration (defaults to whole body concentration.)

restrictive.clearance

If TRUE (default), then only the fraction of chemical not bound to protein is available for metabolism in the liver. If FALSE, then all chemical in the liver is metabolized (faster metabolism due to rapid off-binding).

bioactive.free.invivo

If FALSE (default), then the total concentration is treated as bioactive in vivo. If TRUE, the the unbound (free) plasma concentration is treated as bioactive in vivo. Only works with tissue = NULL in current implementation.

Caco2.options

A list of options to use when working with Caco2 apical to basolateral data Caco2.Pab, default is Caco2.options = list(Caco2.Pab.default = 1.6, Caco2.Fabs = TRUE, Caco2.Fgut = TRUE, overwrite.invivo = FALSE, keepit100 = FALSE). Caco2.Pab.default sets the default value for Caco2.Pab if Caco2.Pab is unavailable. Caco2.Fabs = TRUE uses Caco2.Pab to calculate fabs.oral, otherwise fabs.oral = Fabs. Caco2.Fgut = TRUE uses Caco2.Pab to calculate fgut.oral, otherwise fgut.oral = Fgut. overwrite.invivo = TRUE overwrites Fabs and Fgut in vivo values from literature with Caco2 derived values if available. keepit100 = TRUE overwrites Fabs and Fgut with 1 (i.e. 100 percent) regardless of other settings. See get_fbio for further details.

. Additional parameters passed to parameterize function if parameters is NULL.

Value

Steady state plasma concentration in mg/L units

calc_analytic_css_3comp
```

Calculate the analytic steady state concentration for model 3compartment

Description

This function calculates the analytic steady state plasma or blood concentrations as a result of constant oral infusion dosing. The three compartment model (Pearce et al. 2017) describes the amount of chemical in three key tissues of the body: the liver, the portal vein (essentially, oral absorption from the gut), and a systemic compartment ("sc") representing the rest of the body. See solve_3comp for additional details. The analytical steady-state solution for the three compartment model is:

$$C_{plasma}^{ss} = \frac{dose}{f_{up} * Q_{GFR} + Cl_h + \frac{Cl_h}{Q_l} \frac{f_{up}}{R_{b:p}} Q_{GFR}}$$
$$C_{blood}^{ss} = R_{b:p} * C_{plasma}^{ss}$$

where Q_GFR is the glomerular filtration rate in the kidney, Q_l is the total liver blood flow (hepatic artery plus total vein), Cl_h is the chemical-specific whole liver metabolism clearance (scaled up from intrinsic clearance, which does not depend on flow), f_up is the chemical-specific fraction unbound in plasma, R_b:p is the chemical specific ratio of concentrations in blood:plasma.

Usage

```
calc_analytic_css_3comp(
  chem.name = NULL,
  chem.cas = NULL,
  dtxsid = NULL,
  species = "Human",
  parameters = NULL,
  dosing = list(daily.dose = 1),
  hourly.dose = NULL,
  dose.units = "mg",
  concentration = "plasma",
  suppress.messages = FALSE,
  recalc.blood2plasma = FALSE,
  tissue = NULL,
  restrictive.clearance = TRUE,
```

```
bioactive.free.invivo = FALSE,
  Caco2.options = list(),
   ...
)
```

Arguments

chem. name Either the chemical name, CAS number, or the parameters must be specified.

chem. cas Either the chemical name, CAS number, or the parameters must be specified.

dtxsid EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chem-

ical must be identified by either CAS, name, or DTXSIDs

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

parameters Chemical parameters from parameterize_pbtk (for model = 'pbtk'), parame-

terize_3comp (for model = '3compartment), parameterize_1comp(for model = '1compartment') or parameterize_steadystate (for model = '3compartmentss'),

overrides chem.name and chem.cas.

dosing List of dosing metrics used in simulation, which includes the namesake en-

tries of a model's associated dosing.params. For steady-state calculations this is likely to be either "daily.dose" for oral exposures or "Cinhaled" for inhalation.

hourly.dose Hourly dose rate mg/kg BW/h.

dose.units The units associated with the dose received.

concentration Desired concentration type, 'blood' or default 'plasma'.

suppress.messages

Whether or not the output message is suppressed.

recalc.blood2plasma

Recalculates the ratio of the amount of chemical in the blood to plasma using the input parameters. Use this if you have altered hematocrit, Funbound.plasma,

or Krbc2pu.

tissue Desired tissue conentration (defaults to whole body concentration.)

restrictive.clearance

If TRUE (default), then only the fraction of chemical not bound to protein is available for metabolism in the liver. If FALSE, then all chemical in the liver is

metabolized (faster metabolism due to rapid off-binding).

bioactive.free.invivo

If FALSE (default), then the total concentration is treated as bioactive in vivo. If TRUE, the the unbound (free) plasma concentration is treated as bioactive in vivo. Only works with tissue = NULL in current implementation.

Caco2.options

A list of options to use when working with Caco2 apical to basolateral data Caco2.Pab, default is Caco2.options = list(Caco2.Pab.default = 1.6, Caco2.Fabs = TRUE, Caco2.Fgut = TRUE, overwrite.invivo = FALSE, keepit100 = FALSE). Caco2.Pab.default sets the default value for Caco2.Pab if Caco2.Pab is unavailable. Caco2.Fabs = TRUE uses Caco2.Pab to calculate fabs.oral, otherwise fabs.oral = Fabs. Caco2.Fgut = TRUE uses Caco2.Pab to calculate fgut.oral, otherwise fgut.oral = Fgut. overwrite.invivo = TRUE overwrites Fabs and Fgut in vivo values from literature with Caco2 derived values if available. keepit100

= TRUE overwrites Fabs and Fgut with 1 (i.e. 100 percent) regardless of other settings. See get_fbio for further details.

Additional parameters passed to parameterize function if parameters is NULL.

calc_analytic_css_3comp2

Calculate the analytic steady state concentration for model 3compartment

Description

This function calculates the analytic steady state plasma or blood concentrations as a result of constant oral infusion dosing. The three compartment model (Pearce et al. 2017) describes the amount of chemical in three key tissues of the body: the liver, the portal vein (essentially, oral absorption from the gut), and a systemic compartment ("sc") representing the rest of the body. See solve_3comp for additional details. The analytical steady-state solution for the three compartment model is:

$$C_{plasma}^{ss} = \frac{dose}{f_{up} * Q_{GFR} + Cl_h + \frac{Cl_h}{Q_l} \frac{f_{up}}{R_{b:p}} Q_{GFR}}$$
$$C_{blood}^{ss} = R_{b:p} * C_{plasma}^{ss}$$

where Q_GFR is the glomerular filtration rate in the kidney, Q_l is the total liver blood flow (hepatic artery plus total vein), Cl_h is the chemical-specific whole liver metabolism clearance (scaled up from intrinsic clearance, which does not depend on flow), f_up is the chemical-specific fraction unbound in plasma, R_b:p is the chemical specific ratio of concentrations in blood:plasma.

Usage

```
calc_analytic_css_3comp2(
  chem.name = NULL,
  chem.cas = NULL,
  dtxsid = NULL,
  species = "Human",
  parameters = NULL,
  dosing = list(daily.dose = 1),
  hourly.dose = NULL,
  dose.units = "mg",
  concentration = "plasma",
  suppress.messages = FALSE,
  recalc.blood2plasma = FALSE,
  tissue = NULL,
  route = "oral",
  restrictive.clearance = TRUE,
  bioactive.free.invivo = FALSE,
  Caco2.options = list(),
  exhalation = TRUE,
)
```

Arguments

Either the chemical name, CAS number, or the parameters must be specified. chem.name chem.cas Either the chemical name, CAS number, or the parameters must be specified. dtxsid EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chemical must be identified by either CAS, name, or DTXSIDs Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human"). species parameters Chemical parameters from parameterize_pbtk (for model = 'pbtk'), parameterize_3comp (for model = '3compartment), parameterize_1comp(for model = '1compartment') or parameterize_steadystate (for model = '3compartmentss'), overrides chem.name and chem.cas. dosing List of dosing metrics used in simulation, which includes the namesake entries of a model's associated dosing.params. For steady-state calculations this is likely to be either "daily.dose" for oral exposures or "Cinhaled" for inhalation. hourly.dose Hourly dose rate mg/kg BW/h. dose.units The units associated with the dose received. Desired concentration type, 'blood' or default 'plasma'. concentration suppress.messages Whether or not the output message is suppressed. recalc.blood2plasma

Recalculates the ratio of the amount of chemical in the blood to plasma using the input parameters. Use this if you have altered hematocrit, Funbound.plasma, or Krbc2pu.

tissue Desired tissue conentration (defaults to whole body concentration.)

route Route of exposure ("inhalation" or [DEFAULT] "oral").

restrictive.clearance

If TRUE (default), then only the fraction of chemical not bound to protein is available for metabolism in the liver. If FALSE, then all chemical in the liver is metabolized (faster metabolism due to rapid off-binding).

bioactive.free.invivo

If FALSE (default), then the total concentration is treated as bioactive in vivo. If TRUE, the the unbound (free) plasma concentration is treated as bioactive in vivo. Only works with tissue = NULL in current implementation.

Caco2.options

A list of options to use when working with Caco2 apical to basolateral data Caco2.Pab, default is Caco2.options = list(Caco2.Pab.default = 1.6, Caco2.Fabs = TRUE, Caco2.Fgut = TRUE, overwrite.invivo = FALSE, keepit100 = FALSE). Caco2.Pab.default sets the default value for Caco2.Pab if Caco2.Pab is unavailable. Caco2.Fabs = TRUE uses Caco2.Pab to calculate fabs.oral, otherwise fabs.oral = Fabs. Caco2.Fgut = TRUE uses Caco2.Pab to calculate fgut.oral, otherwise fgut.oral = Fgut. overwrite.invivo = TRUE overwrites Fabs and Fgut in vivo values from literature with Caco2 derived values if available. keepit100 = TRUE overwrites Fabs and Fgut with 1 (i.e. 100 percent) regardless of other settings. See get_fbio for further details.

exhalation

A Boolean (TRUE/FALSE) indicating whether exhalation is included as a route of potential clearance (Defaults to TRUE).

... Additional parameters passed to parameterize function if parameters is NULL.

Value

Steady state plasma concentration in mg/L units

Calculate the analytic steady state concentration for the three compartment steady-state model

Description

This function calculates the steady state plasma or venous blood concentrations as a result of constant oral infusion dosing. The equation, initally used for high throughput in vitro-in vivo extrapolation in (Rotroff et al. 2010) and later given in (Wetmore et al. 2012), assumes that the concentration is the inverse of the total clearance, which is the sum of hepatic metabolism and renal filatrion:

$$C_{plasma}^{ss} = \frac{dose}{f_{up} * Q_{GFR} + Cl_h}$$
$$C_{blood}^{ss} = R_{b:p} * C_{plasma}^{ss}$$

where Q_GFR is the glomerular filtration rate in the kidney, Cl_h is the chemical-specific whole liver metabolism clearance (scaled up from intrinsic clearance, which does not depend on flow), f_up is the chemical-specific fraction unbound in plasma, R_b:p is the chemical specific ratio of concentrations in blood:plasma.

Usage

```
calc_analytic_css_3compss(
  chem.name = NULL,
  chem.cas = NULL,
  dtxsid = NULL,
  parameters = NULL,
  dosing = list(daily.dose = 1),
  hourly.dose = NULL,
  dose.units = "mg",
  concentration = "plasma",
  suppress.messages = FALSE,
  recalc.blood2plasma = FALSE,
  tissue = NULL,
  restrictive.clearance = TRUE,
  bioactive.free.invivo = FALSE,
  Caco2.options = list(),
)
```

Arguments

chem. name Either the chemical name, CAS number, or the parameters must be specified.

chem. cas Either the chemical name, CAS number, or the parameters must be specified.

dtxsid EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chemical must be identified by either CAS, name, or DTXSIDs

parameters Chemical parameters from parameterize_pbtk (for model = 'pbtk'), parame-

terize_3comp (for model = '3compartment), parameterize_1comp(for model = '1compartment') or parameterize_steadystate (for model = '3compartmentss'),

overrides chem.name and chem.cas.

dosing List of dosing metrics used in simulation, which includes the namesake en-

tries of a model's associated dosing.params. For steady-state calculations this is likely to be either "daily.dose" for oral exposures or "Cinhaled" for inhalation.

hourly.dose Hourly dose rate mg/kg BW/h.

dose.units The units associated with the dose received.

concentration Desired concentration type, 'blood' or default 'plasma'.

suppress.messages

Whether or not the output message is suppressed.

recalc.blood2plasma

Recalculates the ratio of the amount of chemical in the blood to plasma using the input parameters. Use this if you have 'altered hematocrit, Funbound.plasma, or Krbc2pu.

Kroc2p

tissue Desired tissue concentration (defaults to whole body concentration.)

restrictive.clearance

If TRUE (default), then only the fraction of chemical not bound to protein is available for metabolism in the liver. If FALSE, then all chemical in the liver is metabolized (faster metabolism due to rapid off-binding).

bioactive.free.invivo

If FALSE (default), then the total concentration is treated as bioactive in vivo. If TRUE, the the unbound (free) plasma concentration is treated as bioactive in vivo. Only works with tissue = NULL in current implementation.

Caco2.options

A list of options to use when working with Caco2 apical to basolateral data Caco2.Pab, default is Caco2.options = list(Caco2.Pab.default = 1.6, Caco2.Fabs = TRUE, Caco2.Fgut = TRUE, overwrite.invivo = FALSE, keepit100 = FALSE). Caco2.Pab.default sets the default value for Caco2.Pab if Caco2.Pab is unavailable. Caco2.Fabs = TRUE uses Caco2.Pab to calculate fabs.oral, otherwise fabs.oral = Fabs. Caco2.Fgut = TRUE uses Caco2.Pab to calculate fgut.oral, otherwise fgut.oral = Fgut. overwrite.invivo = TRUE overwrites Fabs and Fgut in vivo values from literature with Caco2 derived values if available. keepit100 = TRUE overwrites Fabs and Fgut with 1 (i.e. 100 percent) regardless of other settings. See get_fbio for further details.

Additional parameters passed to parameterize function if parameters is NULL.

Details

. . .

This equation is a simplification of the steady-state plasma concentration in the three-comprtment model (see solve_3comp), neglecting a higher order term that causes this Css to be higher for very rapidly cleared chemicals.

Value

Steady state plasma concentration in mg/L units

Calculate the analytic steady state plasma concentration for model pbtk.

Description

This function calculates the analytic steady state concentration (mg/L) as a result of constant oral infusion dosing. Concentrations are returned for plasma by default, but various tissues or blood concentrations can also be given as specified.

Usage

```
calc_analytic_css_pbtk(
  chem.name = NULL,
  chem.cas = NULL,
  dtxsid = NULL,
  species = "Human",
  parameters = NULL,
  dosing = list(daily.dose = 1),
  hourly.dose = NULL,
  dose.units = "mg",
  concentration = "plasma",
  suppress.messages = FALSE,
  recalc.blood2plasma = FALSE,
  tissue = NULL,
```

```
restrictive.clearance = TRUE,
bioactive.free.invivo = FALSE,
Caco2.options = list(),
...
)
```

Arguments

chem. name Either the chemical name, CAS number, or the parameters must be specified. chem. cas Either the chemical name, CAS number, or the parameters must be specified.

dtxsid EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chem-

ical must be identified by either CAS, name, or DTXSIDs

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

parameters Chemical parameters from parameterize_pbtk (for model = 'pbtk'), parame-

terize_3comp (for model = '3compartment), parameterize_1comp(for model = '1compartment') or parameterize_steadystate (for model = '3compartmentss'),

in vivo values from literature with Caco2 derived values if available. keepit100 = TRUE overwrites Fabs and Fgut with 1 (i.e. 100 percent) regardless of other settings. See get_fbio for further details.

. Additional parameters passed to parameterize function if parameters is NULL.

Details

The PBTK model (Pearce et al. 2017) predicts the amount of chemical in various tissues of the body. A system of ordinary differential equations describes how the amounts in each tissue change as a function of time. The analytic steady-state equation was found by algebraically solving for the tissue concentrations that result in each equation being zero – thus determining the concentration at which there is no change over time as the result of a fixed infusion dose rate.

The analytical solution is:

$$C_{ven}^{ss} = \frac{doserate * \frac{Q_{liver} + Q_{gut}}{f_{B_{brp}} * Cl_{metabolism} + (Q_{liver} + Q_{gut})}}{Q_{cardiac} - \frac{(Q_{liver} + Q_{gut})^2}{\frac{f_{up}}{R_{b:p}} * Cl_{metabolism} + (Q_{liver} + Q_{gut})} - \frac{(Q_{kidney})^2}{\frac{f_{up}}{R_{b:p}} * Q_{GFR} + Q_{kideny}} - Q_{rest}}}$$

$$C_{plasma}^{ss} = \frac{C_{ven}^{ss}}{R_{b:p}}$$

$$C_{tissue}^{ss} = \frac{K_{tissue:fuplasma} * f_{up}}{R_{b:p}} * C_{ven}^{ss}$$

where Q_cardiac is the cardiac output, Q_gfr is the glomerular filtration rate in the kidney, other Q's indicate blood flows to various tissues, Cl_metabolism is the chemical-specific whole liver metabolism clearance, f_up is the chemical-specific fraction unbound in plasma, R_b2p is the chemical specific ratio of concentrations in blood:plasma, K_tissue2fuplasma is the chemical- and tissue-specific equilibrium partition coefficient and dose rate has units of mg/kg/day.

Value

Steady state plasma concentration in mg/L units

calc_analytic_css_sumclearances

Calculate the steady state concentration for the sum of clearances steady-state model with exhalation

Description

This function calculates the analytic steady state plasma or venous blood concentrations as a result of infusion dosing.

Usage

```
calc_analytic_css_sumclearances(
  chem.name = NULL,
  chem.cas = NULL,
  dtxsid = NULL,
  species = "Human",
  parameters = NULL,
  dosing = list(daily.dose = 1),
  hourly.dose = NULL,
  dose.units = "mg",
  concentration = "plasma",
  Caco2.options = NULL,
  suppress.messages = FALSE,
  recalc.blood2plasma = FALSE,
  tissue = NULL,
  route = "oral",
  restrictive.clearance = TRUE,
  bioactive.free.invivo = FALSE,
)
```

Arguments

| chem.name | Either the chemical name, CAS number, or the parameters must be specified. |
|-------------|---|
| chem.cas | Either the chemical name, CAS number, or the parameters must be specified. |
| dtxsid | EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chemical must be identified by either CAS, name, or DTXSIDs |
| species | Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human"). |
| parameters | Chemical parameters from parameterize_sumclearances overrides chem.name and chem.cas. |
| dosing | List of dosing metrics used in simulation, which includes the namesake entries of a model's associated dosing.params. For steady-state calculations this is likely to be either "daily.dose" for oral exposures or "Cinhaled" for inhalation. |
| hourly.dose | Hourly dose rate mg/kg BW/h. |

dose.units The units associated with the dose received.

concentration Desired concentration type, 'blood' or default 'plasma'.

Caco2.options

A list of options to use when working with Caco2 apical to basolateral data Caco2.Pab, default is Caco2.options = list(Caco2.Pab.default = 1.6, Caco2.Fabs = TRUE, Caco2.Fgut = TRUE, overwrite.invivo = FALSE, keepit100 = FALSE). Caco2.Pab.default sets the default value for Caco2.Pab if Caco2.Pab is unavailable. Caco2.Fabs = TRUE uses Caco2.Pab to calculate fabs.oral, otherwise fabs.oral = Fabs. Caco2.Fgut = TRUE uses Caco2.Pab to calculate fgut.oral, otherwise fgut.oral = Fgut. overwrite.invivo = TRUE overwrites Fabs and Fgut in vivo values from literature with Caco2 derived values if available. keepit100 = TRUE overwrites Fabs and Fgut with 1 (i.e. 100 percent) regardless of other settings. See get_fbio for further details.

suppress.messages

Whether or not the output message is suppressed.

recalc.blood2plasma

Recalculates the ratio of the amount of chemical in the blood to plasma using the input parameters. Use this if you have 'altered hematocrit, Funbound.plasma, or Krbc2pu.

tissue Desired tissue concentration (defaults to whole body concentration.)

route Route of exposure ("inhalation" or [DEFAULT] "oral").

restrictive.clearance

If TRUE (default), then only the fraction of chemical not bound to protein is available for metabolism in the liver. If FALSE, then all chemical in the liver is metabolized (faster metabolism due to rapid off-binding).

bioactive.free.invivo

If FALSE (default), then the total concentration is treated as bioactive in vivo. If TRUE, the the unbound (free) plasma concentration is treated as bioactive in vivo. Only works with tissue = NULL in current implementation.

Additional parameters passed to parameterize function if parameters is NULL.

Value

Steady state plasma concentration in mg/L units

Author(s)

John Wambaugh

```

calc_clearance_frac 49

calc_clearance_frac Calculate the fractional contributions to total clearance

Description

Steady-state clearance is a function of multiple processes. For example, meabolism in the liver and glomerular filtration in the kidney. This function takes a list of parameters potentially impacting total clearance and iteratively sets all but one of the parameters to zero. This allows calculation of the fration of total clearance driven by that parameter.

Usage

```
calc_clearance_frac(
  fraction.params = c("Clint", "Qgfrc"),
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  parameters = NULL,
  species = "human",
  default.to.human = FALSE,
  suppress.messages = FALSE,
  model = "3compartmentss",
  restrictive.clearance = TRUE,
  parameterize.args = list(),
  analytic_css.args = list()
)
```

Arguments

fraction.params

A vector of character strings identifying the parameters whose fractional contri-

butions are to be calculated. Defaults to 'Qfgr' and 'Qtotal.liverc'.

chem.cas Chemical Abstract Services Registry Number (CAS-RN) – if parameters is not

specified then the chemical must be identified by either CAS, name, or DTXISD

chem. name Chemical name (spaces and capitalization ignored) – if parameters is not speci-

fied then the chemical must be identified by either CAS, name, or DTXISD

dtxsid EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) - if pa-

rameters is not specified then the chemical must be identified by either CAS,

name, or DTXSIDs

parameters Parameters from the appropriate parameterization function for the model indi-

cated by argument model

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

default.to.human

(Logical) Substitutes missing rat values with human values if TRUE. (Not applicable for 'calc_fabs.oral'.) (Defaults to 'FALSE'.)

50 calc_clearance_frac

suppress.messages

Whether or not the output message is suppressed.

mode1

Model used in calculation, for example'pbtk' for the multiple compartment model, '3compartment' for the three compartment model, and '1compartment' for the one compartment model. Defaults to '3compartmentss'.

restrictive.clearance

Protein binding not taken into account (set to 1) in liver clearance if FALSE.

parameterize.args

Named list of any additional arguments passed to model parameterization function (other than the already-named arguments). Default 'list()' to pass no additional arguments.

analytic_css.args

Arguments to analytical Css function

Value

A numeric fraction unpbound in plasma between zero and one

Author(s)

John Wambaugh

Examples

```
# 3compartmentss model:
calc_clearance_frac(chem.name="bisphenola")
# pbtk model:
calc_clearance_frac(chem.name="bisphenola",
                    model="pbtk",
                    fraction.params=c("Qgfrc","Clmetabolismc"))
# A model with exhalation:
# sumclearances model:
calc_clearance_frac(chem.name="bisphenola",
                    model="sumclearances",
                    fraction.params=c("Clint","Qgfrc","Qalvc"))
calc_clearance_frac(chem.name="toluene",
                    model="sumclearances",
                    fraction.params=c("Clint","Qgfrc","Qalvc"))
# 3comp2 model:
calc_clearance_frac(chem.name="toluene",
                    model="3compartment2",
                    fraction.params=c("Clmetabolismc", "Qgfrc", "Qalvc"))
```

calc_css 51

calc_css

Find the steady state concentration and the day it is reached.

Description

This function finds the day a chemical comes within the specified range of the analytical steady state venous blood or plasma concentration(from calc_analytic_css) for the multiple compartment, three compartment, and one compartment models, the fraction of the true steady state value reached on that day, the maximum concentration, and the average concentration at the end of the simulation.

Usage

```
calc_css(
  chem.name = NULL,
  chem.cas = NULL,
  dtxsid = NULL,
  parameters = NULL,
  species = "Human",
  f = 0.01,
  daily.dose = 1,
  doses.per.day = 3,
  dose.units = "mg/kg",
  route = "oral",
  days = 21,
  output.units = "uM",
  suppress.messages = FALSE,
  tissue = NULL,
  model = "pbtk"
  f.change = 1e-05,
  dosing = NULL,
  parameterize.args.list = list(),
)
```

Arguments

| chem.name | Either the chemical name, CAS number, or parameters must be specified. |
|------------|---|
| chem.cas | Either the chemical name, CAS number, or parameters must be specified. |
| dtxsid | EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chemical must be identified by either CAS, name, or DTXSIDs |
| parameters | Chemical parameters from parameterize_pbtk function, overrides chem.name and chem.cas. |
| species | Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human"). |
| f | Fractional distance from the final steady state concentration that the average concentration must come within to be considered at steady state. |

52 calc_css

daily.dose Total daily dose, mg/kg BW.
doses.per.day Number of oral doses per day.

dose.units The units associated with the dose received.

route Route of exposure (either "oral", "iv", or "inhalation" default "oral").

days Initial number of days to run simulation that is multiplied on each iteration.

output.units Units for returned concentrations, defaults to uM (specify units = "uM") but can

also be mg/L.

suppress.messages

Whether or not to suppress messages.

tissue Desired tissue concentration (default value is NULL, will depend on model –

see steady.state.compartment in model.info file for further details.)

model Model used in calculation, 'pbtk' for the multiple compartment model, '3compartment'

for the three compartment model, and '1compartment' for the one compartment

model.

f. change Fractional change of daily steady state concentration reached to stop calculating.

dosing The dosing object for more complicated scenarios. Defaults to repeated daily.dose

spread out over doses.per.day

parameterize.args.list

Named list of any additional arguments passed to model parameterization function (other than the already-named arguments). Default 'list()' to pass no addi-

tional arguments.

. . . Additional arguments passed to solve_model (defaults model is "pbtk").

Value

frac Ratio of the mean concentration on the day steady state is reached (baed on

doses.per.day) to the analytical Css (based on infusion dosing).

max The maximum concentration of the simulation.

avg The average concentration on the final day of the simulation.

the day the average concentration comes within 100 * p percent of the true

steady state concentration.

calc_dermal_equiv

Calculate Dermal Equivalent Dose

Description

This functions converts a steady state plasma concetration for a given dermal exposure scenario to an equivalent steady state media concentration for a single dose.

Usage

```
calc_dermal_equiv(
  conc,
  chem.name = NULL,
  chem.cas = NULL,
  dtxsid = NULL,
  parameters = NULL,
```

54 calc_dermal_equiv

```
days = 20,
doses.per.day = 3,
skin_depth = 0.3,
skin.pH = 7,
Vmedia = 0.001,
Fskinexposed = 0.1,
...
)
```

Arguments

conc Bioactive in vitro concentration, arbitrary units.

chem. name Either the chemical name or the CAS number must be specified.

chem. cas Either the CAS number or the chemical name must be specified.

dtxsid EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chem-

ical must be identified by either CAS, name, or DTXSIDs

parameters Parameters from parameterize_dermal_pbtk.

days Number of days of simulation.

doses.per.day Number of doses per day.

skin_depth Skin depth, cm.
skin.pH pH of skin/dermis.

Vmedia Volume of media, L, used when parameters are not given.

Fskinexposed Fraction of total skin exposed, used when parameters are not given.

... Additional parameters passed to solve_dermal_pbtk.

Details

Returned dose is dependent on doses.per.day.

Value

Equivalent dose in specified units, default of mg/kg BW/day.

Author(s)

Annabel Meade

calc_dow 55

| calc_dow | Calculate the distribution coefficient |
|----------|--|
|----------|--|

Description

This function estimates the ratio of the equilibrium concentrations of a compound in octanol and water, taking into account the charge of the compound. Given the pH, we assume the neutral (uncharged) fraction of compound partitions according to the hydrophobicity (P_{ow}). We assume that only a fraction alpha (defaults to 0.001 – Schmitt (2008)) of the charged compound partitions into lipid (octanol):

$$D_{ow} = P_{ow} * (F_{neutral} + \alpha * F_{charged})$$

Fractions charged are calculated according to hydrogen ionization equilibria (pKa_Donor, pKa_Accept) using calc_ionization.

Usage

```
calc_dow(
  Pow = NULL,
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  parameters = NULL,
  pH = NULL,
  pKa_Donor = NULL,
  pKa_Accept = NULL,
  fraction_charged = NULL,
  alpha = 0.001
)
```

Arguments

| Pow | Octanol:water partition coefficient (ratio of concentrations) | |
|------------------|--|--|
| chem.cas | Either the chemical name or the CAS number must be specified. | |
| chem.name | Either the chemical name or the CAS number must be specified. | |
| dtxsid | EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chemical must be identified by either CAS, name, or DTXSIDs | |
| parameters | Chemical parameters from a parameterize_MODEL function, overrides chem.name and chem.cas. | |
| рН | pH where ionization is evaluated. | |
| pKa_Donor | Compound H dissociation equilibirum constant(s). Overwrites chem.name and chem.cas. | |
| pKa_Accept | Compound H association equilibirum constant(s). Overwrites chem.name and chem.cas. | |
| fraction_charged | | |

Fraction of chemical charged at the given pH

56 calc_elimination_rate

alpha

Ratio of Distribution coefficient D of totally charged species and that of the neutral form

Value

Distribution coefficient (numeric)

calc_elimination_rate Calculate the elimination rate for a one compartment model

Description

This function calculates an elimination rate from the three compartment steady state model where elimination is entirely due to metablism by the liver and glomerular filtration in the kidneys.

Usage

```
calc_elimination_rate(
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  parameters = NULL,
  species = "Human",
  model = "3compartmentss",
  suppress.messages = TRUE,
  ...
)
```

calc_elimination_rate 57

Arguments

chem. cas Either the cas number or the chemical name must be specified.

Chem. name Either the chemical name or the cas number must be specified.

dtxsid EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chem-

ical must be identified by either CAS, name, or DTXSIDs

parameters Chemical parameters from parameterize_steadystate or 1compartment function,

overrides chem.name and chem.cas.

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

model The model used to calculate total clearance (defaults to "3compartmentss")

suppress.messages

Whether or not the output message is suppressed.

. . . Additional parameters passed to parameterize function if parameters is NULL.

Details

Elimination rate calculated by dividing the total clearance (using the default -stirred hepatic model) by the volume of distribution. When species is specified as rabbit, dog, or mouse, the function uses the appropriate physiological data(volumes and flows) but substitues human fraction unbound, partition coefficients, and intrinsic hepatic clearance.

Value

Elimination rate

Units of 1/h.

Examples

calc_fbio.oral

Functions for calculating the bioavaialble fractions from oral doses

Description

These functions calculate the fraction of chemical absorbed from the gut based upon in vitro measured Caco-2 membrane permeability data. Caco-2 permeabilities (10^{-6} cm/s) are related to effective permeability based on Yang et al. (2007). These functions calculate the fraction absorbed (calc_fabs.oral – S Darwich et al. (2010) and Yu and Amidon (1999)), the fraction surviving first pass gut metabolism (calc_fgut.oral), and the overall systemic oral bioavailability (calc_fbio.oral). Note that the first pass hepatic clearance is calculated within the parameterization and other functions. using calc_hep_bioavailability Absorption rate is calculated according to Fick's law (LennernÄs (1997)) assuming low blood concentrations.

Usage

```
calc_fbio.oral(
  parameters = NULL,
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  species = "Human",
  suppress.messages = FALSE,
  ...
)

calc_fabs.oral(
  parameters = NULL,
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  species = "Human",
```

calc_fbio.oral 59

```
suppress.messages = FALSE,
 Caco2.Pab.default = 1.6
)
calc_peff(
  parameters = NULL,
  chem.cas = NULL,
  chem.name = NULL,
 dtxsid = NULL,
  species = "Human",
  suppress.messages = FALSE,
 Caco2.Pab = NULL,
  parameterize.args.list = list()
)
calc_kgutabs(
  parameters = NULL,
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  species = "Human",
  suppress.messages = FALSE,
 parameterize.args.list = list()
)
calc_fgut.oral(
  parameters = NULL,
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  species = "Human",
  suppress.messages = FALSE,
 Caco2.Pab.default = 1.6,
  parameterize.args.list = list()
```

Arguments

| parameters | (List) A list of the parameters (Caco2.Pab, Funbound.Plasma, Rblood2plasma, Clint, BW, Qsmallintestine, Fabs, Fgut) used in the calculation, either supplied by user or calculated in parameterize_steadystate. |
|------------|---|
| chem.cas | (Character) Chemical CAS number. (Defaults to 'NULL'.) (Note: Either the chemical name, CAS number, or EPA's DSSTox Structure ID must be specified). |
| chem.name | (Character) Chemical name. (Defaults to 'NULL'.) (Note: Either the chemical name, CAS number, or EPA's DSSTox Structure ID must be specified). |
| dtxsid | (Character) EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard). (Defaults to 'NULL'.) (Note: Either the chemical name, CAS number, or EPA's DSSTox Structure ID must be specified). |

60 calc_fbio.oral

```
species (Character) Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

suppress.messages (Logical) Whether or not the output message is suppressed. (Defaults to 'FALSE'.)

... Additional parameters passed to parameterize function if parameters is NULL.

Caco2.Pab.default (Numeric) Caco2 apical to basolateral data. (Defaults to 1.6.) (Not applicable for 'calc_fbio.oral'.)

Caco2.Pab (Numeric) Caco2 apical to basolaterial permeability used by calc_peff parameterize.args.list

List of arguments passed to parameterize_steadystate
```

Details

We assume that systemic oral bioavailability (F_{bio}) consists of three components: (1) the fraction of chemical absorbed from intestinal lumen into enterocytes (F_{abs}) , (2) the fraction surviving intestinal metabolism (F_{gut}) , and (3) the fraction surviving first-pass hepatic metabolism (F_{hep}) . This function returns $(F_{abs} * F_{gut})$.

We model systemic oral bioavailability as $F_{bio} = F_{abs} * F_{gut} * F_{hep}$. F_{hep} is estimated from in vitro TK data using calc_hep_bioavailability. If F_{bio} has been measured in vivo and is found in table chem.physical_and_invitro.data then we set $F_{abs} * F_{gut}$ to the measured value divided by F_{hep} . Otherwise, if Caco2 membrane permeability data or predictions are available F_{abs} is estimated using calc_fgut.oral. Intrinsic hepatic metabolism is used to very roughly estimate (F_{gut}) using calc_fgut.oral. If argument keepit100 is used then there is complete absorption from the gut (that is, $F_{abs} = F_{gut} = 1$).

Value

| fbio.oral | Oral bioavailability, the fraction of oral dose reaching systemic distribution in the body. |
|-----------|---|
| fabs.oral | Fraction of dose absorbed, i.e. the fraction of the dose that enters the gutlumen. |
| fgut.oral | Fraction of chemical surviving first pass metabolism in the gut. |
| fhep.oral | Fraction of chemical surviving first pass hepatic clearance. |
| kgutabs | Rate of absorption from gut (1/h). |

Functions

- calc_fabs.oral(): Calculate the fraction absorbed in the gut (Darwich et al., 2010)
- calc_peff(): Calculate the effective gut permeability rate (10^-4 cm/s)
- calc_kgutabs(): Calculate the gut absorption rate (1/h)
- calc_fgut.oral(): Calculate the fraction of chemical surviving first pass metabolism in the gut

calc_fetal_phys

Calculate maternal-fetal physiological parameters

Description

This function uses the equations from Kapraun (2019) to calculate chemical- independent physiological paramreters as a function of gestational age in weeks.

Usage

```
calc_fetal_phys(week = 12, ...)
```

Arguments

week Gestational week

... Additional arguments to parameterize_fetal_pbtk

Details

```
BW = pre_p regnant_B W + BW_c ubic_t heta1*tw + BW_c ubic_t heta2*tw^2 + BW_c ubic_t heta3*tw^3

calc_fup_correction

Calculate the correction for lipid binding in plasma binding assay

Description

Poulin and Haddad (2012) observed "...that for a highly lipophilic compound, the calculated f_{up} is by far [less than] the experimental values observed under in vitro conditions." Pearce et al. (2017) hypothesized that there was additional lipid binding in vivo that acted as a sink for lipophilic compounds, reducing the effective f_{up} in vivo. It is possible that this is due to the binding of lipophilic compounds on the non plasma-side of the rapid equilibrium dialysis plates (Waters et al., 2008). Pearce et al. (2017) compared predicted and observed tissue partition coefficients for a range of compounds. They showed that predictions were improved by adding additional binding proportional to the distribution coefficient D_{ow} (calc_dow) and the fractional volume of lipid in plasma (F_{lipid}). We calculate F_{lipid} as the sum of the physiological plasma neutral lipid fractional volume and 30 percent of the plasma neutral phospholipid fractional volume. We use values from Peyret et al. (2010) for rats and Poulin and Haddad (2012) for humans. The estimate of 30 percent of the neutral phospholipid volume as neutral lipid was used for simplicity's sake in place of our membrane affinity predictor. To account for additional binding to lipid, plasma to water partitioning $(K_{plasma:water} = \frac{1}{f_{up}})$ is increased as such:

$$f_{up}^{corrected} = \frac{1}{f_{up}^{corrected}} = \frac{1}{K_{nL}^{pl} * F_{lipid} + \frac{1}{f_{up}^{invitro}}}$$

68 calc_fup_correction

Usage

```
calc_fup_correction(
  fup = NULL,
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  parameters = NULL,
  Flipid = NULL,
  plasma.pH = 7.4,
  dow74 = NULL,
  species = "Human",
  default.to.human = FALSE,
  force.human.fup = FALSE,
  suppress.messages = FALSE)
```

Arguments

| | fup | Fraction unbound in plasma, if provided this argument overides values from argument parameters and chem.physical_and_invitro.data |
|-------------------|------------|--|
| | chem.cas | Chemical Abstract Services Registry Number (CAS-RN) – if parameters is not specified then the chemical must be identified by either CAS, name, or DTXISD |
| | chem.name | Chemical name (spaces and capitalization ignored) – if parameters is not specified then the chemical must be identified by either CAS, name, or DTXISD $$ |
| | dtxsid | EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) – if parameters is not specified then the chemical must be identified by either CAS, name, or DTXSIDs |
| | parameters | Parameters from the appropriate parameterization function for the model indicated by argument model |
| | Flipid | The fractional volume of lipid in plasma (from physiology.data) |
| | plasma.pH | pH of plasma (default 7.4) |
| | dow74 | The octanol-water distribution ratio (DOW). |
| | species | Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human"). |
| default.to.human | | |
| | | Substitutes missing fraction of unbound plasma with human values if true. |
| force.human.fup | | |
| | | Returns human fraction of unbound plasma in calculation for rats if true. When species is specified as rabbit, dog, or mouse, the human unbound fraction is substituted. |
| suppress.messages | | |

Details

Note that octanal:water partitioning above 1:1,000,000 ($LogD_{ow} > 6$) are truncated at 1:1,000,000 because greater partitioning would likely take longer than protein binding assay itself.

Whether or not the output message is suppressed.

calc_half_life 69

Value

A numeric fraction unpbound in plasma between zero and one

calc_half_life

Calculates the half-life for a one compartment model.

Description

This function calculates the half life from the three compartment steady state model where elimination is entirely due to metabolism by the liver and glomerular filtration in the kidneys.

Usage

```
calc_half_life(
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  parameters = NULL,
```

70 calc_half_life

```
species = "Human",
model = "3compartmentss",
suppress.messages = TRUE,
...
)
```

Arguments

chem. cas Either the cas number or the chemical name must be specified.

chem. name Either the chemical name or the cas number must be specified.

dtxsid EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chem-

ical must be identified by either CAS, name, or DTXSIDs

parameters Chemical parameters from parameterize_steadystate or 1compartment function,

overrides chem.name and chem.cas.

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

The model used to calculate elimination rate (defaults to "3compartmentss")

suppress.messages

Whether or not the output message is suppressed.

... Additional parameters passed to parameterize function if parameters is NULL.

Details

Half life is calculated by dividing the natural-log of 2 by the elimination rate from the one compartment model.

Value

```
Half life Units of h.
```

Author(s)

Sarah E. Davidson

  suppress.messages=TRUE)
```

calc_hepatic_clearance

Calculate the hepatic clearance (deprecated).

Description

This function is included for backward compatibility. It calls calc_hep_clearance which calculates the hepatic clearance in plasma for a well-stirred model or other type if specified. Based on Ito and Houston (2004)

Usage

```
calc_hepatic_clearance(
  chem.name = NULL,
  chem.cas = NULL,
  dtxsid = NULL,
  parameters = NULL,
  species = "Human",
  default.to.human = FALSE,
  hepatic.model = "well-stirred",
  suppress.messages = FALSE,
  well.stirred.correction = TRUE,
  restrictive.clearance = TRUE,
  adjusted.Funbound.plasma = TRUE,
  ...
)
```

Arguments

chem. name Either the chemical name, CAS number, or the parameters must be specified.

Either the chemical name, CAS number, or the parameters must be specified.

EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chemical must be identified by either CAS, name, or DTXSIDs

Chemical parameters from parameterize_steadystate function, overrides chem.name and chem.cas.

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human"). default.to.human

Substitutes missing animal values with human values if true.

hepatic.model Model used in calculating hepatic clearance, unscaled, parallel tube, dispersion, or default well-stirred.

suppress.messages

Whether or not to suppress the output message.

well.stirred.correction

Uses correction in calculation of hepatic clearance for well-stirred model if TRUE for hepatic.model well-stirred. This assumes clearance relative to amount unbound in whole blood instead of plasma, but converted to use with plasma concentration.

restrictive.clearance

Protein binding not taken into account (set to 1) in liver clearance if FALSE. adjusted.Funbound.plasma

Whether or not to use Funbound.plasma adjustment if calculating Rblood2plasma.

. . . Additional parameters passed to parameterize_steadystate if parameters is NULL.

Value

```
Hepatic Clearance
Units of L/h/kg BW.
```

calc_hep_bioavailability
```

Calculate first pass heaptic metabolism

Description

For models that don't described first pass blood flow from the gut, need to cacluate a hepatic bioavailability, that is, the fraction of chemical systemically available after metabolism during the first pass through the liver (Rowland, 1973 Equation 29, where k21 is blood flow through the liver and k23 is clearance from the liver in Figure 1 in that paper).

Usage

```
calc_hep_bioavailability(
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  parameters = NULL,
  restrictive.clearance = TRUE,
  default.to.human = FALSE,
  flow.34 = TRUE,
  suppress.messages = FALSE,
  species = "Human"
)
```

74 calc_hep_clearance

Arguments

chem. cas Chemical Abstract Services Registry Number (CAS-RN) – if parameters is not specified then the chemical must be identified by either CAS, name, or DTXISD

chem. name Chemical name (spaces and capitalization ignored) – if parameters is not speci-

fied then the chemical must be identified by either CAS, name, or DTXISD

dtxsid EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) – if pa-

rameters is not specified then the chemical must be identified by either CAS,

name, or DTXSIDs

parameters Parameters from the appropriate parameterization function for the model indi-

cated by argument model

restrictive.clearance

Protein binding not taken into account (set to 1) in liver clearance if FALSE.

default.to.human

Substitutes missing animal values with human values if true (hepatic intrinsic

clearance or fraction of unbound plasma).

flow. 34 A logical constraint

suppress.messages

Whether or not to suppress the output message.

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

Value

A data.table whose columns are the parameters of the HTTK model specified in model.

Author(s)

John Wambaugh

References

Rowland M, Benet LZ, Graham GG (1973). "Clearance concepts in pharmacokinetics." *Journal of pharmacokinetics and biopharmaceutics*, **1**(2), 123–136. doi:10.1007/BF01059626.

calc_hep_clearance Calculate the hepatic clearance.

Description

This function calculates the hepatic clearance in plasma for using the "well-stirred" model by default. Other scaling options from (Ito and Houston 2004) are also available. Parameters for scaling from flow-free intrinsic-hepatic clearance to whole-liver metabolism rate are taken from (Carlile et al. 1997). In vitro measured hepatic clearace is corrected for estimated binding in the in vitro clearance assay using the model of (Kilford et al. 2008). The agument restrictive clearance (defaults to TRUE) describes the significance (or lack thereof) of plasma protein binding in metabolism. Restrictive clearance assumes that only the free fraction of chemical in plasma is available for

calc_hep_clearance 75

metabolism. Non-restrictive clearance assumes that the compound is weakly bound to plasma protein and any free chemical metabolized is instantly replaced. For non-restrictive clearance the effective fup = 1.

Usage

```
calc_hep_clearance(
  chem.name = NULL,
  chem.cas = NULL,
  dtxsid = NULL,
  parameters = NULL,
  hepatic.model = "well-stirred",
  suppress.messages = FALSE,
 well.stirred.correction = TRUE,
  restrictive.clearance = TRUE,
  species = "Human",
  adjusted.Funbound.plasma = TRUE,
)
```

Arguments

chem.name Either the chemical name, CAS number, or the parameters must be specified.

chem.cas Either the chemical name, CAS number, or the parameters must be specified.

dtxsid EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chem-

ical must be identified by either CAS, name, or DTXSIDs

Chemical parameters from parameterize_steadystate function, overrides chem.name parameters

hepatic.model Model used in calculating hepatic clearance, unscaled, parallel tube, dispersion,

or default well-stirred.

suppress.messages

Whether or not to suppress the output message.

well.stirred.correction

Uses the (Yang et al. 2007) blood:plasma ratio correction in the calculation of hepatic clearance for well-stirred model if TRUE if argument hepatic.model = "well-stirred".

restrictive.clearance

If TRUE (default) the rate of metabolism is restricted to the unbound fraction of chemical. If FALSE the free fraction is set to 1 (that is, plasma protein binding

is weak and metabolzied chemical is rapidly replaced)

Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human"). species adjusted.Funbound.plasma

> Uses the (Pearce et al. 2017) lipid binding adjustment for Funbound.plasma (which also impacts partition coefficients such as blood:plasma ratio) when set to TRUE (Default).

Additional parameters passed to parameterize_steadystate if parameters is NULL.

76 calc_hep_fu

Value

Hepatic Clearance

Units of L/h/kg BW.

calc_hep_fu

Calculate the free chemical in the hepaitic clearance assay

Description

This function uses the method from Kilford et al. (2008) to calculate the fraction of unbound chemical in the hepatocyte intrinsic clearance assay. The bound chemical is presumed to be unavailable during the performance of the assay, so this fraction can be used to increase the apparent clearance rate to better estimate in vivo clearance. For bases, the fraction of chemical unbound in hepatocyte clearance assays (fu_{hep}) is calculated in terms of $logP_{ow}$ but for neutrual and acidic compounds

calc_hep_fu 77

we use $log D_{ow}$ (from calc_dow). Here we denote the appropriate partition coefficient as "logP/D". Kilford et al. (2008) calculates

$$fu_{hep} = \frac{1}{1 + 125 * V_R * 10^{0.072*logP*D^2 + 0.067*logP/D - 1.126}}$$

Usage

```
calc_hep_fu(
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  parameters = NULL,
  Vr = 0.005,
  pH = 7.4
)
```

Arguments

| chem.cas | Chemical Abstract Services Registry Number (CAS-RN) – if parameters is not specified then the chemical must be identified by either CAS, name, or DTXISD |
|------------|--|
| chem.name | Chemical name (spaces and capitalization ignored) – if parameters is not specified then the chemical must be identified by either CAS, name, or DTXISD |
| dtxsid | EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) – if parameters is not specified then the chemical must be identified by either CAS, name, or DTXSIDs |
| parameters | Parameters from the appropriate parameterization function for the model indicated by argument model |
| Vr | Ratio of cell volume to incubation volume. Default (0.005) is taken from |
| рН | pH of the incupation medium. |
| | |

Details

Note that octanal:water partitioning above 1:1,000,000 ($LogP_{ow} > 6$) are truncated at 1:1,000,000 because greater partitioning would likely take longer than hepatocyte assay itself.

Value

A numeric fraction between zero and one

calc_ionization

Calculate the ionization.

Description

This function calculates the ionization of a compound at a given pH. The pKa's are either entered as parameters or taken from a specific compound in the package. The arguments pKa_Donor and pKa_Accept may be single numbers, characters, or vectors. We support characters because there are many instances with multiple predicted values and all those values can be included by concatenating with commas (for example, pKa_Donor = "8.1,8.6". Finally, pka_Donor and pKa_Accept may be vectors of characters representing different chemicals or instances of chemical parameters to allow for uncertainty analysis. A null value for pKa_Donor or pKa_Accept is interpretted as no argument provided, while " " is taken as a prediction of no ionization possible at any pH.

Usage

```
calc_ionization(
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  parameters = NULL,
  pH = NULL,
  pKa_Donor = NULL,
  pKa_Accept = NULL,
  return_charge_matrix = FALSE
)
```

Arguments

chem. cas Either the chemical name or the CAS number must be specified.

chem. name Either the chemical name or the CAS number must be specified.

dtxsid EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chemical

must be identified by either CAS, name, or DTXSIDs

calc_ionization 79

parameters Chemical parameters from a parameterize_MODEL function, overrides chem.name

and chem.cas.

pH where ionization is evaluated.

pKa_Donor Compound H dissociation equilibirum constant(s). Overwrites chem.name and

chem.cas.

pKa_Accept Compound H association equilibirum constant(s). Overwrites chem.name and

chem.cas.

return_charge_matrix

If TRUE, the function returns a table describing each ionization state considered

by the calculations in this function (defaults to FALSE)

Details

It is very important to note that pKb = 14 - pKa. But if a predictor gives us a doinor pKa, we just accept it as a pKa.

For hydrogen donor sites, a hydrogen is present in the molecule that can be donated to the solution if the concentration of hydrogens gets low enough. This causes the molecule to become more negatively charged. This is an acid. For hydrogen acceptor suits a location exist in the molecule that can accept an additional history if the concentration of hydrogens gets sufficiently high. This causes the molecule to become more positively charged. This is a base.

We make several assumptions about ionization in order to make our calculations. First, we assume ionization is either due to either "donating" (losing) a hydrogen ion (a positively charge proton) to the solution or by "accepting" (gaining) a hydrogen ion from the solution. Generally, acids are hydrogen donors and bases are hydrogen acceptors. Second, pH is the negative log10 concentration of hydrogen atoms. The lower the pH, the more hydrogen atoms. So, acids donate their hydrogen atoms as pH of the solution increases. Bases accept their hydrogen atoms as pH decreases. Third, each predicted pKa is a prediction that a specific location (or site) on molecule X can either donate or accept a hydrogen. Fourth, the pKa value indicates the pH at which half of the molecules of X have ionized at the site, and half have not. The concentration of the two forms are equal. Fifth, if there are N pKa's for molecule X, then there are N sites that can ionize. Technically this means that there are 2^N different ionization states for molecule X (where each site is or is not ionized). However, pKa predictors give the equlibrium only for pairs of ionization states. So, we only consider N + 1 ionizations states for X – the state immediately above and below each pKa.

To understand the different charge states we annotate the nonionizable backbone of a molecule as "X". For each site on X that is capable of donating a hydrogen we add a "D" to the right of "X". For each site on X that has accepted a hydrogen, we add a "A" to the right of "X". We read the A's and D's from left to right, with the one occuring at the lowest pH first. So a typical acid ionization would be: $XD \rightarrow X$ - and a typical base ionization would be $XA+\rightarrow X$. Where things get complicated is if there are multiple donor and acceptor states. In particular, it is possible for a compound to have a net zero charge, but be simultaneously positively and negatively charged. Such a state is called a Zwitter ion. For example: $XDAA++\rightarrow XAA+\rightarrow XA$. The state XA is technically neutral because' X has donated one hydrogen, but also accepted one hydrogen. XA is a Zwitter ion.

Each pKa gives the equlibrium ratio of two states pH - pKa = log10[X/XD] for donation or pOH - pka = log10[X/XA] for accepting. pOH = 14 - pH. Separating the logarithm into log10[X] - log10[XD] lets us see that Cn = Xn - Xn - 1 where Cn = pH - pKa for donor pKa's and Cn = 14 - pH - pKa for acceptor pKa's. We can rewrite $log10Xn = Sum_i = 1$:n Ci + log10X1. So we can calculate each Xn by summing all the ratios between Xn and the lowest state (X1). Then, by requiring that

80 calc_ionization

```
all Xi sum to 1, we have: 1 = \text{Sum\_i}=1:\text{N }10^{\text{X}}i = \text{Sum\_i}=1:\text{N }10^{\text{(Sum\_j}}=1:i (Cj + log10X1))} = X1 * \text{Sum\_i}=1:\text{N }10^{\text{(Sum\_j}}=1:i Cj)} so that X1 = 1 / \text{Sum\_i}=1:\text{N }10^{\text{(Sum\_j}}=1:i Cj)}
```

The sum im the denominator is the ratio from X1 to each state (including X1). We use a table called "charge_matrix" to keep track of all N + 1 ionization states and the ratio of each state to the next.

calc_kair

Calculate air:matrix partition coefficients

Description

This function uses the methods colleced by Linakis et al. (2020) to calculate air partition coefficients for blood, water, and mucus.

Usage

```
calc_kair(
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  parameters = NULL,
  species = "Human",
  adjusted.Funbound.plasma = TRUE,
  fup.lod.default = 0.005,
  force.human.clint.fup = FALSE,
  minimum.Funbound.plasma = 1e-04,
  default.to.human = FALSE,
  suppress.messages = FALSE,
  pH = 7.4,
  alpha = 0.001
)
```

Arguments

chem.cas

Chemical Abstract Services Registry Number (CAS-RN) – if parameters is not specified then the chemical must be identified by either CAS, name, or DTXISD

82 calc_kair

chem. name Chemical name (spaces and capitalization ignored) – if parameters is not speci-

fied then the chemical must be identified by either CAS, name, or DTXISD

dtxsid EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) – if pa-

rameters is not specified then the chemical must be identified by either CAS,

name, or DTXSIDs

parameters Parameters from the appropriate parameterization function for the model indi-

cated by argument model. Can include parameters "logHenry" and "body_temp",

but if not included standard values are looked up from httk tables.

species Species used for body temperature, defaults to "Human"

adjusted.Funbound.plasma

Uses Pearce et al. (2017) lipid binding adjustment for Funbound.plasma (which impacts partition coefficients) when set to TRUE (Default).

fup.lod.default

Default value used for fraction of unbound plasma for chemicals where measured value was below the limit of detection. Default value is 0.0005.

force.human.clint.fup

Uses human hepatic intrinsic clearance and fraction of unbound plasma in calculation of partition coefficients for rats if true.

minimum.Funbound.plasma

Monte Carlo draws less than this value are set equal to this value (default is 0.0001 – half the lowest measured Fup in our dataset).

default.to.human

Substitutes missing species-specific values with human values if TRUE (default is FALSE).

suppress.messages

Whether or not the output messages are suppressed.

pH where ionization is evaluated.

alpha Ratio of Distribution coefficient D of totally charged species and that of the

neutral form

Details

The blood:air partition coefficient (PB:A) was calculated as

$$P_{B:A} = \frac{P_{B:A} * R_{B:P}}{f_{up}}$$

where P_B:A is the blood:air partition, RB:P is the blood:plasma partition ratio, fup is the fraction unbound in the plasma, and P_W:A is the water:air partition coefficient:

$$\frac{R*T_{body}}{HLC*P}$$

where R is the gas constant (8.314 J/mol/K), T_body is the species-specific body temperature (K) from physiology.data, HLC is the Henry's Law Constant (atm*m^3 / mol), and P is conversion factor from atmospheres to Pascals (1 atm = 101325 Pa).

calc_krbc2pu 83

In the isopropanol PBTK model published by Clewell et al. (2001) it was noted that certain chemicals are likely to be absorbed into the mucus or otherwise trapped in the upper respiratory tract (URT). Following Scott (2014), the air:mucus partition coefficient (PA:M) calculated as

$$log_{10}(\frac{1}{K_{water2air}}) - (log_{10}(P_{ow}) - 1) * 0.524$$

where Pow is the octanol/water partition coefficient

Value

A named list containing the blood:air, water:air, and mucus:air partition coefficients

calc_krbc2pu

Back-calculates the Red Blood Cell to Unbound Plasma Partition Coefficient

Description

Given an observed ratio of chemical concentration in blood to plasma, this function calculates a Red Blood Cell to unbound plasma (Krbc2pu) partition coefficient that would be consistent with that observation.

84 calc_krbc2pu

Usage

```
calc_krbc2pu(
  Rb2p,
  Funbound.plasma,
  hematocrit = NULL,
  default.to.human = FALSE,
  species = "Human",
  suppress.messages = TRUE
)
```

Arguments

Rb2p The chemical blood:plasma concentration ratop

Funbound.plasma

The free fraction of chemical in the presence of plasma protein Rblood2plasma.

hematocrit Overwrites default hematocrit value in calculating Rblood2plasma.

default.to.human

Substitutes missing animal values with human values if true.

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human"). suppress.messages

Determine whether to display certain usage feedback.

Value

The red blood cell to unbound chemical in plasma partition coefficient.

calc_ma 85

calc_ma

Calculate the membrane affinity

Description

Membrane affinity (MA) is the membrane:water partition coefficient. MA chacterizes chemical partitioning into membranes formed from neutral phospholipids (K_{nPL}). Pearce et al. (2017) compared five different methods for predicting membrane affinity using measured data for 59 compounds. The method of Yun and Edgington (2013) was identified as the best:

$$MA = 10^{(1.294 + 0.304 * log_{10}(P_{ow}))}$$

Usage

```
calc_ma(
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  parameters = NULL,
  suppress.messages = FALSE,
  pfas.calibration = TRUE
)
```

Arguments

| chem.cas | cas Chemical Abstract Services Registry Number (CAS-RN) – if parameters is specified then the chemical must be identified by either CAS, name, or DTXI | | | |
|-------------------|--|--|--|--|
| chem.name | Chemical name (spaces and capitalization ignored) – if parameters is not spe fied then the chemical must be identified by either CAS, name, or DTXISD | | | |

calc_mc_css

Distribution of chemical steady state concentration with uncertainty and variability

Description

For a given chemical and fixed dose rate this function determines a distribution of steady-state concentrations reflecting measurement uncertainty an population variability. Uncertainty and variability are simulated via the Monte Carlo method – many sets of model parameters are drawn according to probability distributions described in Ring et al. (2017) (doi:10.1016/j.envint.2017.06.004) for human variability and Wambaugh et al. (2019) (doi:10.1093/toxsci/kfz205) for measurement uncertainty. Monte Carlo samples are generated by the function create_mc_samples. To allow rapid application of the Monte Carlo method we make use of analytical solutions for the steady-state concentration for a particular model via a given route (when available) as opposed to solving the model numerically (that is, using differential equations). For each sample of the Monte Carlo method (as specified by argument samples) the parameters for the analytical solution are varied. An ensemble of steady-state predictions are produced, though by default only the quantiles specified by argument which quantile are provided. If the full set of predicted values are desired use set the argument return samples to TRUE.

Usage

```
calc_mc_css(
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  parameters = NULL,
  samples = 1000,
  which.quantile = 0.95,
  species = "Human",
  daily.dose = 1,
  suppress.messages = FALSE,
 model = "3compartmentss",
  httkpop = TRUE,
  httkpop.dt = NULL,
  invitrouv = TRUE,
  calcrb2p = TRUE,
  censored.params = list(),
  vary.params = list(),
  return.samples = FALSE,
  tissue = NULL,
  concentration = "plasma",
  output.units = "mg/L",
  invitro.mc.arg.list = NULL,
  httkpop.generate.arg.list = list(method = "direct resampling"),
  convert.httkpop.arg.list = NULL,
  parameterize.args.list = NULL,
```

```
calc.analytic.css.arg.list = NULL,
  Caco2.options = NULL
)
```

Arguments

chem. cas Chemical Abstract Services Registry Number (CAS-RN) – if parameters is not

specified then the chemical must be identified by either CAS, name, or DTXISD

chem.name Chemical name (spaces and capitalization ignored) – if parameters is not speci-

fied then the chemical must be identified by either CAS, name, or DTXISD

dtxsid EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) – if pa-

rameters is not specified then the chemical must be identified by either CAS,

name, or DTXSIDs

parameters Parameters from the appropriate parameterization function for the model indi-

cated by argument model

samples Number of samples generated in calculating quantiles.

which quantile Which quantile from Monte Carlo simulation is requested. Can be a vector.

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

Species must be set to "Human" to run httkpop model.

daily.dose Total daily dose, mg/kg BW.

suppress.messages

Whether or not to suppress output message.

model Model used in calculation, 'gas_pbtk' for the gas pbtk model, 'pbtk' for the mul-

tiple compartment model, '3compartment' for the three compartment model, '3compartmentss' for the three compartment steady state model, and '1compartment' for one compartment model. This only applies when httkpop=TRUE

and species="Human", otherwise '3compartmentss' is used.

httkpop Whether or not to use population generator and sampler from httkpop. This is

overwrites censored.params and vary.params and is only for human physiology.

Species must also be set to 'Human'.

httkpop.dt A data table generated by httkpop_generate. This defaults to NULL, in which

case httkpop_generate is called to generate this table.

invitrouv Logical to indicate whether to include in vitro parameters in uncertainty and

variability analysis

calcrb2p Logical determining whether or not to recalculate the chemical ratio of blood to

plasma

censored.params

The parameters listed in censored params are sampled from a normal distribution that is censored for values less than the limit of detection (specified separately for each parameter). This argument should be a list of sublists. Each sublist is named for a parameter in "parameters" and contains two elements: "CV" (coefficient of variation) and "LOD" (limit of detection, below which parameter values are censored. New values are sampled with mean equal to the value in "parameters" and standard deviation equal to the mean times the CV. Censored values are sampled on a uniform distribution between 0 and the limit of detection. Not used with httkpop model.

vary.params

The parameters listed in vary params are sampled from a normal distribution that is truncated at zero. This argument should be a list of coefficients of variation (CV) for the normal distribution. Each entry in the list is named for a parameter in "parameters". New values are sampled with mean equal to the value in "parameters" and standard deviation equal to the mean times the CV. Not used with httkpop model.

return.samples Whether or not to return the vector containing the samples from the simulation instead of the selected quantile.

tissue

Desired steady state tissue concentration. Default is of NULL typically gives whole body plasma concentration.

concentration

Desired concentration type: 'blood', 'tissue', or default 'plasma'. In the case that the concentration is for plasma, selecting "blood" will use the blood:plasma ratio to estimate blood concentration. In the case that the argument 'tissue' specifies a particular tissue of the body, concentration defaults to 'tissue' - that is, the concentration in the If cocentration is set to 'blood' or 'plasma' and 'tissue' specifies a specific tissue then the value returned is for the plasma or blood in that specific tissue.

output.units

Plasma concentration units, either uM or default mg/L.

invitro.mc.arg.list

List of additional parameters passed to invitro_mc

httkpop.generate.arg.list

Additional parameters passed to httkpop_generate.

convert.httkpop.arg.list

Additional parameters passed to the convert httkpop * function for the model.

parameterize.args.list

A list of arguments to be passed to the model parameterization function (that is, parameterize_MODEL) corresponding to argument "model". (Defaults to NULL.)

calc.analytic.css.arg.list

Additional parameters passed to

Caco2.options

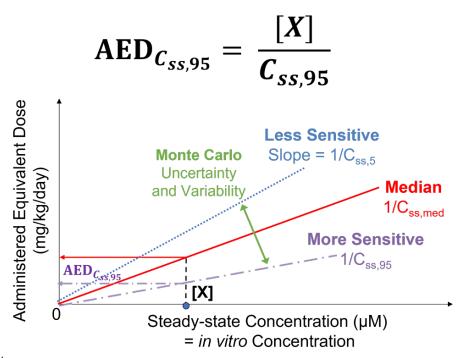

Arguments describing how to handle Caco2 absorption data that are passed to invitro_mc and the parameterize [MODEL] functions. See get_fbio for further details.

calc_analytic_css.

Details

The chemical-specific steady-state concentration for a dose rate of 1 mg/kg body weight/day can be used for in in vitro-in vivo extrapolation (IVIVE) of a bioactive in vitro concentration by dividing the in vitro concentration by the steady-state concentration to predict a dose rate (mg/kg/day) that would produce that concentration in plasma. Using quantiles of the distribution (such as the upper 95th percentile) allow incorporation of uncertainty and variability into IVIVE.

Reverse Dosimetry Toxicodynamic IVIVE

altalt

Figure from Breen et al. (2021) (doi:10.1080/17425255.2021.1935867) shows reverse dosimetry toxicodynamic IVIVE. Equivalent external dose is determined by solving the TK model in reverse by deriving the external dose (that is, TK model input) that produces a specified internal concentration (that is, TK model output). Reverse dosimetry and IVIVE using HTTK relies on the linearity of the models. We calculate a scaling factor to relate *in vitro* concentrations (uM) to administered equivalent doses (AED). The scaling factor is the inverse of the steady state plasma concentration (Css) predicted for a 1 mg/kg/day exposure dose rate. We use Monte Carlo to simulate variability and propagate uncertainty; for example, to calculate an upper 95th percentile Css,95 for individuals who get higher plasma concentrations from the same exposure.

The Monte Carlo methods used here were recently updated and described by Breen et al. (submitted).

httk-pop is used only for humans. For non-human species biological variability is simulated by drawing parameters from uncorellated log-normal distributions.

Chemical-specific httk data are available primarily for human and for a few hundred chemicals in rat. All in silico predictions are for human. Thus, when species is specified as rabbit, dog, or mouse, the user can choose to set the argument default.to.human to TRUE so that this function uses the appropriate physiological data (volumes and flows) but substitutes human fraction unbound, partition coefficients, and intrinsic hepatic clearance.

If the argument tissue is used, the steady-state concentration in that tissue, if available, is provided. If that tissue is included in the model used (specified by argument model) then the actual tissue concentration is provided. Otherwise, the tissue-specific partition coefficient is used to estimate the concentration from the plasma.

The six sets of plausible IVIVE assumptions identified by Honda et al. (2019) (doi:10.1371/journal.pone.0217564) are:

| | in vivo Conc. | Metabolic Clearance | Bioactive Chemical Conc. | TK Statistic Used* |
|--------|------------------|---------------------|--------------------------|--------------------|
| Honda1 | Veinous (Plasma) | Restrictive | Free | Mean Conc. |
| Honda2 | Veinous | Restrictive | Free | Max Conc. |
| Honda3 | Veinous | Non-restrictive | Total | Mean Conc. |
| Honda4 | Veinous | Non-restrictive | Total | Max Conc. |
| Honda5 | Target Tissue | Non-restrictive | Total | Mean Conc. |
| Honda6 | Target Tissue | Non-restrictive | Total | Max Conc. |

^{*}Assumption is currently ignored because analytical steady-state solutions are currently used by this function.

Value

Quantiles (specified by which.quantile) of the distribution of plasma steady-stae concentration (Css) from the Monte Carlo simulation

calc_mc_oral_equiv

Calculate Monte Carlo Oral Equivalent Dose

Description

This function converts a chemical plasma concentration to an oral adminstered equivalent dose (AED) using a concentration obtained from calc_mc_css. This function uses reverse dosimetry-based 'in vitro-in vivo extrapolation (IVIVE) for high throughput risk screening. The user can input the chemical and in vitro bioactive concentration, select the TK model, and then automatically predict the in vivo AED which would produce a body concentration equal to the in vitro bioactive concentration. This function relies on the Monte Carlo method (via funcion create_mc_samples to simulate both uncertainty and variability so that the result is a distribution of equivalent doses, from which we provide specific quantiles (specified by which.quantile), though the full set of predictions can be obtained by setting return.samples to TRUE.

Usage

```
calc_mc_oral_equiv(
  conc,
  chem.name = NULL,
  chem.cas = NULL.
  dtxsid = NULL,
  parameters = NULL,
  which.quantile = 0.95,
  species = "Human"
  input.units = "uM",
  output.units = "mgpkgpday",
  suppress.messages = FALSE,
  return.samples = FALSE,
  restrictive.clearance = TRUE,
  bioactive.free.invivo = FALSE,
  tissue = NULL,
  concentration = "plasma",
  IVIVE = NULL,
  model = "3compartmentss",
  Caco2.options = list(),
  calc.analytic.css.arg.list = list(),
```

```
)
```

Arguments

conc Bioactive in vitro concentration in units of uM.

chem. name Either the chemical name or the CAS number must be specified.

chem. cas Either the CAS number or the chemical name must be specified.

dtxsid EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chem-

ical must be identified by either CAS, name, or DTXSIDs

parameters Parameters from the appropriate parameterization function for the model indi-

cated by argument model

which.quantile Which quantile from Monte Carlo steady-state simulation (calc_mc_css) is re-

quested. Can be a vector. Note that 95th concentration quantile is the same

population as the 5th dose quantile.

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

input.units Units of given concentration, default of uM but can also be mg/L.

output.units Units of dose, default of 'mgpkgpday' for mg/kg BW/ day or 'umolpkgpday'

for umol/ kg BW/ day.

suppress.messages

Suppress text messages.

return.samples Whether or not to return the vector containing the samples from the simulation

instead of the selected quantile.

restrictive.clearance

Protein binding not taken into account (set to 1) in liver clearance if FALSE.

bioactive.free.invivo

If FALSE (default), then the total concentration is treated as bioactive in vivo. If TRUE, the the unbound (free) plasma concentration is treated as bioactive in

vivo. Only works with tissue = NULL in current implementation.

tissue Desired steady state tissue concentration. Default is of NULL typically gives

whole body plasma concentration.

concentration Desired concentration type: 'blood', 'tissue', or default 'plasma'. In the case that

the concentration is for plasma, selecting "blood" will use the blood:plasma ratio to estimate blood concentration. In the case that the argument 'tissue' specifies a particular tissue of the body, concentration defaults to 'tissue' – that is, the concentration in the If cocentration is set to 'blood' or 'plasma' and 'tissue' specifies a specific tissue then the value returned is for the plasma or blood in

that specific tissue.

IVIVE Honda et al. (2019) identified six plausible sets of assumptions for in vitro-

in vivo extrapolation (IVIVE) assumptions. Argument may be set to "Honda1" through "Honda6". If used, this function overwrites the tissue, restrictive.clearance, and bioactive.free.invivo arguments. See Details below for more information.

model Model used in calculation, 'gas_pbtk' for the gas pbtk model, 'pbtk' for the mul-

tiple compartment model, '3compartment' for the three compartment model,

'3compartmentss' for the three compartment steady state model, and '1compartment' for one compartment model. This only applies when httkpop=TRUE and species="Human", otherwise '3compartmentss' is used.

Caco2.options

A list of options to use when working with Caco2 apical to basolateral data Caco2.Pab, default is Caco2.options = list(Caco2.Pab.default = 1.6, Caco2.Fabs = TRUE, Caco2.Fgut = TRUE, overwrite.invivo = FALSE, keepit100 = FALSE). Caco2.Pab.default sets the default value for Caco2.Pab if Caco2.Pab is unavailable. Caco2.Fabs = TRUE uses Caco2.Pab to calculate fabs.oral, otherwise fabs.oral = Fabs. Caco2.Fgut = TRUE uses Caco2.Pab to calculate fgut.oral, otherwise fgut.oral = Fgut. overwrite.invivo = TRUE overwrites Fabs and Fgut in vivo values from literature with Caco2 derived values if available. keepit100 = TRUE overwrites Fabs and Fgut with 1 (i.e. 100 percent) regardless of other settings. See get_fbio for further details.

calc.analytic.css.arg.list

A list of options to pass to the analytic steady-state calculation function. This includes 'restrictive.clearance', 'bioactive.free.invivo', 'IVIVE', 'wellstirred.correction', and 'adjusted.Funbound.plasma'.

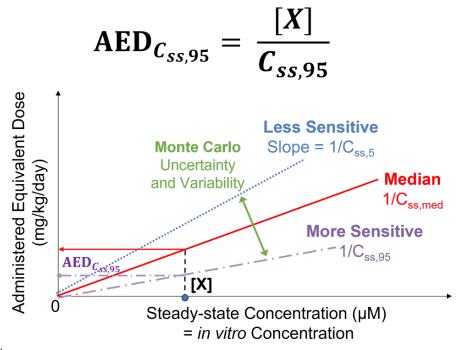

... Additional parameters passed to calc_mc_css for httkpop and variance of parameters.

Details

The chemical-specific steady-state concentration for a dose rate of 1 mg/kg body weight/day can be used for in IVIVE of a bioactive *in vitro* concentration by dividing the *in vitro* concentration by the steady-state concentration to predict a dose rate (mg/kg/day) that would produce that concentration in plasma. Using quantiles of the distribution (such as the upper 95th percentile) allow incorporation of uncertainty and variability into IVIVE.

This approach relies on the linearity of the models to calculate a scaling factor to relate in vitro concentrations (uM) with AED. The scaling factor is the inverse of the steady-state plasma concentration (Css) predicted for a 1 mg/kg/day exposure dose rate where *in vitro* concentration [X] and Css must be in the same units. Note that it is typical for *in vitro* concentrations to be reported in units of uM and Css in units of mg/L, in which case one must be converted to the other.

Reverse Dosimetry Toxicodynamic IVIVE

altalt

Figure from Breen et al. (2021) (doi:10.1080/17425255.2021.1935867) shows reverse dosimetry toxicodynamic IVIVE. Equivalent external dose is determined by solving the TK model in reverse by deriving the external dose (that is, TK model input) that produces a specified internal concentration (that is, TK model output). Reverse dosimetry and IVIVE using HTTK relies on the linearity of the models. We calculate a scaling factor to relate *in vitro* concentrations (uM) to AEDs. The scaling factor is the inverse of the Css predicted for a 1 mg/kg/day exposure dose rate. We use Monte Carlo to simulate variability and propagate uncertainty; for example, to calculate an upper 95th percentile Css,95 for individuals who get higher plasma concentrations from the same exposure.

The Monte Carlo methods used here were recently updated and described by Breen et al. (submitted).

All arguments after httkpop only apply if httkpop is set to TRUE and species to "Human".

When species is specified as rabbit, dog, or mouse, the function uses the appropriate physiological data(volumes and flows) but substitutes human fraction unbound, partition coefficients, and intrinsic hepatic clearance.

Tissue concentrations are calculated for the pbtk model with oral infusion dosing. All tissues other than gut, liver, and lung are the product of the steady state plasma concentration and the tissue to plasma partition coefficient.

The six sets of plausible IVIVE assumptions identified by Honda et al. (2019) (doi:10.1371/journal.pone.0217564) are:

| | in vivo Conc. | Metabolic Clearance | Bioactive Chemical Conc. | TK Statistic Used* |
|--------|------------------|---------------------|--------------------------|--------------------|
| Honda1 | Veinous (Plasma) | Restrictive | Free | Mean Conc. |
| Honda2 | Veinous | Restrictive | Free | Max Conc. |
| Honda3 | Veinous | Non-restrictive | Total | Mean Conc. |

| Honda4 | Veinous | Non-restrictive | Total | Max Conc. |
|--------|---------------|-----------------|-------|------------|
| Honda5 | Target Tissue | Non-restrictive | Total | Mean Conc. |
| Honda6 | Target Tissue | Non-restrictive | Total | Max Conc. |

^{*}Assumption is currently ignored because analytical steady-state solutions are currently used by this function.

Value

Equivalent dose in specified units, default of mg/kg BW/day.

 propagate.invitrouv.arg.list = NULL,
  return.all.sims = FALSE
)
```

Arguments

chem. cas Either the CAS number, parameters, or the chemical name must be specified.

Either the chemical parameters, name, or the CAS number must be specified.

Either the chemical parameters, name, or the CAS number must be specified.

EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chemical must be identified by either CAS, name, or DTXSIDs

Parameters from parameterize_MODEL, which must align with model. Not used with httkpop model.

samples Number of samples generated in calculating quantiles.

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

Species must be set to "Human" to run httkpop model.

suppress.messages

Whether or not to suppress output message.

model Model used in calculation: 'pbtk' for the multiple

Model used in calculation: 'pbtk' for the multiple compartment model, '3compartment' for the three compartment model, '3compartmentss' for the three compartment steady state model, and '1compartment' for one compartment model. This only applies when httkpop=TRUE and species="Human", otherwise '3compartmentss' is used.

httkpop Whether or not to use population generator and sampler from httkpop. This is

overwrites censored.params and vary.params and is only for human physiology.

Species must also be set to 'Human'.

httkpop.dt A data table generated by httkpop_generate. This defaults to NULL, in which

case httkpop_generate is called to generate this table.

invitrouv Logical to indicate whether to include in vitro parameters in uncertainty and

variability analysis

calcrb2p Logical determining whether or not to recalculate the chemical ratio of blood to

plasma

censored.params

The parameters listed in censored.params are sampled from a normal distribution that is censored for values less than the limit of detection (specified separately for each parameter). This argument should be a list of sub-lists. Each sublist is named for a parameter in "parameters" and contains two elements: "CV" (coefficient of variation) and "LOD" (limit of detection, below which parameter values are censored. New values are sampled with mean equal to the value in "parameters" and standard deviation equal to the mean times the CV. Censored values are sampled on a uniform distribution between 0 and the limit of detection. Not used with httkpop model.

vary.params

The parameters listed in vary.params are sampled from a normal distribution that is truncated at zero. This argument should be a list of coefficients of variation (CV) for the normal distribution. Each entry in the list is named for a parameter in "parameters". New values are sampled with mean equal to the value in "parameters" and standard deviation equal to the mean times the CV. Not used with httkpop model.

return.samples Whether or not to return the vector containing the samples from the simulation instead of the selected quantile.

tissue

Desired steady state tissue conentration.

output.units

Plasma concentration units, either uM or default mg/L.

solvemodel.arg.list

Additional arguments ultimately passed to solve_model

Caco2.options

A list of options to use when working with Caco2 apical to basolateral data Caco2.Pab, default is Caco2.options = list(Caco2.default = 2, Caco2.Fabs = TRUE, Caco2.Fgut = TRUE, overwrite.invivo = FALSE, keepit100 = FALSE). Caco2.default sets the default value for Caco2.Pab if Caco2.Pab is unavailable. Caco2.Fabs = TRUE uses Caco2.Pab to calculate fabs.oral, otherwise fabs.oral = Fabs. Caco2.Fgut = TRUE uses Caco2.Pab to calculate fgut.oral, otherwise fgut.oral = Fgut. overwrite.invivo = TRUE overwrites Fabs and Fgut in vivo values from literature with Caco2 derived values if available. keepit100 = TRUE overwrites Fabs and Fgut with 1 (i.e. 100 percent) regardless of other settings.

invitro.mc.arg.list

List of additional parameters passed to invitro_mc

httkpop.generate.arg.list

Additional parameters passed to httkpop_generate.

convert.httkpop.arg.list

Additional parameters passed to the convert_httkpop_* function for the model.

parameterize.args.list

Additional parameters passed to the parameterize_* function for the model.

propagate.invitrouv.arg.list

List of additional parameters passed to create_mc_samples.

return.all.sims

Logical indicating whether to return the results of all simulations, in addition to the default toxicokinetic statistics

Details

The Monte Carlo methods used here were recently updated and described by Breen et al. (submitted).

All arguments after httkpop only apply if httkpop is set to TRUE and species to "Human".

When species is specified as rabbit, dog, or mouse, the function uses the appropriate physiological data(volumes and flows) but substitutes human fraction unbound, partition coefficients, and intrinsic hepatic clearance.

The six sets of plausible *in vitro-in vivo* extrapolation (IVIVE) assumptions identified by Honda et al. (2019) (doi:10.1371/journal.pone.0217564) are:

| | in vivo Conc. | Metabolic Clearance | Bioactive Chemical Conc. | TK Statistic Used |
|--------|------------------|---------------------|--------------------------|-------------------|
| Honda1 | Veinous (Plasma) | Restrictive | Free | Mean Conc. |
| Honda2 | Veinous | Restrictive | Free | Max Conc. |
| Honda3 | Veinous | Non-restrictive | Total | Mean Conc. |
| Honda4 | Veinous | Non-restrictive | Total | Max Conc. |
| Honda5 | Target Tissue | Non-restrictive | Total | Mean Conc. |
| Honda6 | Target Tissue | Non-restrictive | Total | Max Conc. |

NOTE: This function, and [create_mc_samples()], calculate oral bioavailability parameters based on Caco2 data. If you are comparing the output of this function to the output of [solve_model()], you will need to to ensure that [solve_model()] also uses Caco2 data, rather than its default behavior of using *in vivo* oral bioavailability data when available. To do that, please pass the following argument to [solve_model()]: 'Caco2.options = list(overwrite.invivo = TRUE'.

Value

If return.all.sims == FALSE (default) a list with:

means The mean concentration for each model compartment as a function of time

across the Monte Carlo simulation

sds The standard deviation for each model compartment as a function of time across

the Monte Carlo simulation

If return.all.sums == TRUE then a list is returned with:

stats The list of means and sds from return.all.sums=FALSE

sims The concentration vs. time results for each compartment for every (samples) set

of parameters in the Monte Carlo simulation

```

calc_rblood2plasma

Calculate the constant ratio of the blood concentration to the plasma concentration.

Description

This function calculates the constant ratio of the blood concentration to the plasma concentration.

Usage

```
calc_rblood2plasma(
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  parameters = NULL,
```

106 calc_rblood2plasma

```
hematocrit = NULL,
Krbc2pu = NULL,
Funbound.plasma = NULL,
default.to.human = FALSE,
species = "Human",
adjusted.Funbound.plasma = TRUE,
class.exclude = TRUE,
suppress.messages = TRUE
)
```

Arguments

chem. cas Either the CAS number or the chemical name must be specified.

Chem. name Either the chemical name or the CAS number must be specified.

dtxsid EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chem-

ical must be identified by either CAS, name, or DTXSIDs

parameters Parameters from parameterize_schmitt

hematocrit Overwrites default hematocrit value in calculating Rblood2plasma.

Krbc2pu The red blood cell to unbound plasma chemical partition coefficient, typically

from predict_partitioning_schmitt

Funbound.plasma

The fraction of chemical unbound (free) in the presence of plasma protein

default.to.human

Substitutes missing animal values with human values if true.

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

adjusted.Funbound.plasma

Whether or not to use Funbound.plasma adjustment.

class.exclude Exclude chemical classes identified as outside of domain of applicability by

relevant modelinfo_[MODEL] file (default TRUE).

suppress.messages

Determine whether to display certain usage feedback.

Details

The red blood cell (RBC) parition coefficient as predicted by the Schmitt (2008) method is used in the calculation. The value is calculated with the equation: 1 - hematocrit + hematocrit * Krbc2pu * Funbound.plasma, summing the red blood cell to plasma and plasma:plasma (equal to 1) partition coefficients multiplied by their respective fractional volumes. When species is specified as rabbit, dog, or mouse, the function uses the appropriate physiological data (hematocrit and temperature), but substitutes human fraction unbound and tissue volumes.

Value

The blood to plasma chemical concentration ratio

calc_stats

Calculate toxicokinetic summary statistics (deprecated).

Description

#' This function is included for backward compatibility. It calls calc_tkstats which calculates the area under the curve, the mean, and the peak values for the venous blood or plasma concentration of a specified chemical or all chemicals if none is specified for the multiple compartment model with a given number of days, dose, and number of doses per day.

Usage

```
calc_stats(
  chem.name = NULL,
  chem.cas = NULL,
  dtxsid = NULL,
  parameters = NULL,
  route = "oral",
  stats = c("AUC", "peak", "mean"),
  species = "Human",
  days = 28,
  daily.dose = 1,
  dose = NULL,
  doses.per.day = 1,
  output.units = "uM",
  concentration = "plasma",
  tissue = "plasma",
 model = "pbtk",
  default.to.human = FALSE,
  adjusted.Funbound.plasma = TRUE,
```

108 calc_stats

```
regression = TRUE,
restrictive.clearance = TRUE,
suppress.messages = FALSE,
...
)
```

Arguments

chem. name Name of desired chemical.

chem. cas CAS number of desired chemical.

dtxsid EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chem-

ical must be identified by either CAS, name, or DTXSIDs

parameters Chemical parameters from parameterize_pbtk function, overrides chem.name

and chem.cas.

route String specification of route of exposure for simulation: "oral", "iv", "inhala-

tion", ...

stats Desired values (either 'AUC', 'mean', 'peak', or a vector containing any com-

bination).

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

days Length of the simulation.

daily.dose Total daily dose, mg/kg BW.

dose Amount of a single dose at time zero, mg/kg BW.

doses.per.day Number of doses per day.

output.units Desired units (either "mg/L", "mg", "umol", or default "uM").

concentration Desired concentration type, 'blood' or default 'plasma'.

tissue Desired steady state tissue conentration.

model Model used in calculation, 'pbtk' for the multiple compartment model, '3compartment'

for the three compartment model, '3compartmentss' for the three compartment

steady state model, and '1compartment' for one compartment model.

default.to.human

Substitutes missing animal values with human values if true (hepatic intrinsic

clearance or fraction of unbound plasma).

adjusted.Funbound.plasma

Uses adjusted Funbound.plasma when set to TRUE along with partition coeffi-

cients calculated with this value.

regression Whether or not to use the regressions in calculating partition coefficients.

restrictive.clearance

Protein binding not taken into account (set to 1) in liver clearance if FALSE.

suppress.messages

Whether to suppress output message.

.. Arguments passed to solve function.

calc_tkstats 109

Details

Default value of 0 for doses.per.day solves for a single dose.

When species is specified as rabbit, dog, or mouse, the function uses the appropriate physiological data(volumes and flows) but substitues human fraction unbound, partition coefficients, and intrinsic hepatic clearance.

Value

AUC Area under the plasma concentration curve.

mean.conc The area under the curve divided by the number of days.

peak.conc The highest concentration.

Author(s)

Robert Pearce and John Wambaugh

calc_tkstats

Calculate toxicokinetic summary statistics.

Description

This function calculates the area under the curve, the mean, and the peak values for the venous blood or plasma concentration of a specified chemical or all chemicals if none is specified for the multiple compartment model with a given number of days, dose, and number of doses per day.

Usage

```
calc_tkstats(
  chem.name = NULL,
  chem.cas = NULL,
  dtxsid = NULL,
  parameters = NULL,

triclosan.stats <- calc_tkstats(days=10, chem.name = "triclosan")
calc_tkstats(dtxsid="DTXSID0020442",days=1)
calc_tkstats(dtxsid="DTXSID0020442",days=10)
calc_tkstats(dtxsid="DTXSID0020442",days=100)</pre>
```

calc_total_clearance Calculate the total plasma clearance.

Description

This function calculates the total clearance rate for a one compartment model for plasma where clearance is entirely due to metablism by the liver and glomerular filtration in the kidneys, identical to clearance of three compartment steady state model.

Usage

```
calc_total_clearance(
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  parameters = NULL,
  model = "3compartmentss",
  suppress.messages = FALSE,
  species = "Human",
  ...
)
```

Arguments

chem. cas Either the chemical name, CAS number, or the parameters must be specified. chem. name Either the chemical name, CAS number, or the parameters must be specified. 112 calc_vdist

dtxsid EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chemical

must be identified by either CAS, name, or DTXSIDs

parameters Chemical parameters from parameterize_steadystate function, overrides chem.name

and chem.cas.

model The model used to calculate total clearance (defaults to "3compartmentss")

suppress.messages

Whether or not the output message is suppressed.

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

... Additional parameters passed to parameterize function if parameters is NULL.

Value

Total Clearance

Units of L/h/kg BW.

Author(s)

John Wambaugh

Examples

```
calc_total_clearance(chem.name="Ibuprofen")
```

calc_vdist

Calculate the volume of distribution for a one compartment model.

Description

This function predicts partition coefficients for all tissues using predict_partitioning_schmitt, then lumps them into a single compartment.

Usage

```
calc_vdist(
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  parameters = NULL,
  suppress.messages = FALSE,
  adjusted.Funbound.plasma = TRUE,
  species = "Human",
  default.to.human = FALSE,
   ...
)
```

calc_vdist 113

Arguments

chem.cas Either the CAS number or the chemical name must be specified when Fun-

bound.plasma is not given in parameter list.

chem. name Either the chemical name or the CAS number must be specified when Fun-

bound.plasma is not given in parameter list.

dtxsid EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chem-

ical must be identified by either CAS, name, or DTXSIDs

parameters Parameters from parameterize_3comp, parameterize_pbtk or predict_partitioning_schmitt.

suppress.messages

Whether or not the output message is suppressed.

adjusted.Funbound.plasma

Uses Pearce et al. (2017) lipid binding adjustment for Funbound.plasma (which

impacts partition coefficients) when set to TRUE (Default).

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

default.to.human

Substitutes missing animal values with human values if true.

... Additional parameters passed to parameterize function if parameters is NULL.

Details

The effective volume of distribution is calculated by summing each tissues volume times it's partition coefficient relative to plasma. Plasma, and the paritioning into RBCs are also added to get the total volume of distribution in L/KG BW. Partition coefficients are calculated using Schmitt's (2008) method. When species is specified as rabbit, dog, or mouse, the function uses the appropriate physiological data(volumes and flows) but substitues human fraction unbound, partition coefficients, and intrinsic hepatic clearance.

Value

Volume of distribution

Units of L/kg BW.

CAS.checksum

Test the check digit of a CAS number to confirm validity

Description

Chemical abstracts services registry numbers (CAS-RN) include a final digit as a "checksum" to test for validity (that is, that the number has not been corrupted).

Usage

```
CAS.checksum(CAS.string)
```

Arguments

CAS.string

A character string of three numbers separated by two dashes

cas_id_check 115

Details

The check digit (final number) is calculated by working from right to left, starting with the second to last digit of the CAS-RN. We multiply each digit by an increasing digit (1, 2, 3...) and sum as we work from right to left. The check digit should equal the final digit of the sum.

Value

logical (TRUE if final digit of CAS is consistent with other digits)

Author(s)

John Wambaugh

cas_id_check

CAS number format check function

Description

This function checks whether the CAS/CARN chemical identifier follows the anticipated format of XXXXXXX-YY-Z (i.e. 2-7 digits, 2 digits, and 1 digit, respectively).

Usage

cas_id_check(cas)

Arguments

cas

A character string, or vector of character strings, indicating CAS/CASRN number.

Value

Logical output (TRUE or FALSE) indicating whether the character string(s) provided match the anticipated format for a CAS/CASRN chemical identifier.

116 check_model

check_model

Check for sufficient model parameters

Description

This function halt model evaluation if not all the needed parameters (as specified in the modelinfo_[MODEL].r file) are available. The function uses get_cheminfo, so if the chemical has been checked against that function already then evaluation should proceed as expected. If you do not have the parameters you need and are using a non-human species try default.to.human = TRUE (there are many more values for human than any other species). If working in human, try first using load_dawson2021, load_sipes2017, or load_pradeep2020.

Usage

```
check_model(
  chem.name = NULL,
  chem.cas = NULL,
  dtxsid = NULL,
  model = NULL,
  species = NULL,
  class.exclude = TRUE,
  physchem.exclude = TRUE,
  default.to.human = FALSE
)
```

Arguments

| | chem.name | Chemical name (spaces and capitalization ignored) – if parameters is not specified then the chemical must be identified by either CAS, name, or DTXISD |
|------------------|---------------|---|
| | chem.cas | Chemical Abstract Services Registry Number (CAS-RN) – if parameters is not specified then the chemical must be identified by either CAS, name, or DTXISD |
| | dtxsid | EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) – if parameters is not specified then the chemical must be identified by either CAS, name, or DTXSIDs |
| | model | Model to be checked, modelinfo files specify the requrements of each model. |
| | species | Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human"). |
| | class.exclude | Exclude chemical classes identified as outside of domain of applicability by relevant modelinfo_[MODEL] file (default TRUE). |
| physchem.exclude | | |
| | | Exclude chemicals on the basis of physico-chemical properties (currently only |

fault TRUE).

default.to.human

Substitutes missing fraction of unbound plasma with human values if true.

Henry's law constant) as specified by the relevant modelinfo_[MODEL] file (de-

Value

Stops code from running if all parameters needed for model are not available, otherwise does nothing.

chem.invivo.PK.aggregate.data

Parameter Estimates from Wambaugh et al. (2018)

Description

This table includes 1 and 2 compartment fits of plasma concentration vs time data aggregated from chem.invivo.PK.data, performed in Wambaugh et al. 2018. Data includes volume of distribution (Vdist, L/kg), elimination rate (kelim, 1/h), gut absorption rate (kgutabs, 1/h), fraction absorbed (Fabsgut), and steady state concentration (Css, mg/L).

118 chem.invivo.PK.data

chem.invivo.PK.data

Published toxicokinetic time course measurements

Description

This data set includes time and dose specific measurements of chemical concentration in tissues taken from animals administered control doses of the chemicals either orally or intravenously. This plasma concentration-time data is from rat experiments reported in public sources. Toxicokinetic data were retrieved from those studies by the Netherlands Organisation for Applied Scientific Research (TNO) using curve stripping (TechDig v2). This data is provided for statistical analysis as in Wambaugh et al. 2018.

Usage

chem.invivo.PK.data

Format

A data.frame containing 597 rows and 13 columns.

chem.invivo.PK.summary.data

Summary of published toxicokinetic time course experiments

Description

This data set summarizes the time course data in the chem.invivo.PK.data table. Maximum concentration (Cmax), time integrated plasma concentration for the duration of treatment (AUC.treatment) and extrapolated to zero concentration (AUC.infinity) as well as half-life are calculated. Summary values are given for each study and dosage. These data can be used to evaluate toxicokinetic model predictions.

Usage

chem.invivo.PK.summary.data

Format

A data.frame containing 100 rows and 25 columns.

 ${\tt chem.physical_and_invitro.data}$

Physico-chemical properties and in vitro measurements for toxicokinetics

Description

This data set contains the necessary information to make basic, high-throughput toxicokinetic (HTTK) predictions for compounds, including Funbound.plasma, molecular weight (g/mol), logP, logMA (membrane affinity), intrinsic clearance(uL/min/10^6 cells), and pKa. These data have been compiled from multiple sources, and can be used to parameterize a variety of toxicokinetic models. See variable EPA.ref for information on the reference EPA.

Usage

chem.physical_and_invitro.data

Format

A data frame containing 9411 rows and 54 columns.

Column Name Description

Compound The preferred name of the chemical compound

The preferred Chemical Abstracts Service Registry Number **CAS** CAS.Checksum A logical indicating whether the CAS number is valid

DTXSID DSSTox Structure ID (https://comptox.epa.gov/dashboard) Formula The proportions of atoms within the chemical compound All.Compound.Names All names of the chemical as they occured in the data

The log10 Henry's law constant (Conc_air = 10^logH * Conc_liquid) logHenry

logHenry.Reference Reference for Henry's law constant

logP The log10 octanol:water partition coefficient (PC)

logP.Reference Reference for logPow logPwa The log10 water:air PC logPwa.Reference Reference for logPwa

The log10 phospholipid:water PC or "Membrane affinity" logMA

Reference for membrane affinity logMA.Reference logWSol The log10 water solubility logWSol.Reference Reference for logWsol

The chemical compound melting point MP

MP.Reference Reference for melting point

The chemical compound molecular weight MW

MW.Reference Reference for molecular weight

pKa_Accept The hydrogen acceptor equilibria concentrations

pKa_Accept.Reference Reference for pKa_Accept

The hydrogen acceptor equilibria concentrations pKa_Donor

Reference for pKa_Donor pKa_Donor.Reference

All.Species All species for which data were available

DTXSID.Reference Reference for DTXSID

Formula.Reference Reference for chemical formulat

(Primary hepatocyte suspension) intrinsic hepatic clearance. Entries with comma separat [SPECIES].Clint Probability that there is no clearance observed. Values close to 1 indicate clearance is not [SPECIES].Clint.pValue

[SPECIES].Rblood2plasma.Ref Reference for Rblood2plasma

Chemical.Class All classes to which the chemical has been assigned

Details

In some cases the rapid equilbrium dailysis method (Waters et al., 2008) fails to yield detectable concentrations for the free fraction of chemical. In those cases we assume the compound is highly bound (that is, Fup approaches zero). For some calculations (for example, steady-state plasma concentration) there is precendent (Rotroff et al., 2010) for using half the average limit of detection, that is 0.005. We do not recomend using other models where quantities like partition coefficients must be predicted using Fup. We also do not recomend including the value 0.005 in training sets for Fup predictive models.

Note that in some cases the **Funbound.plasma** and the **intrinsic clearance** are *provided as a series of numbers separated by commas*. These values are the result of Bayesian analysis and characterize a distribution: the first value is the median of the distribution, while the second and third values are the lower and upper 95th percentile (that is qunatile 2.5 and 97.5) respectively. For intrinsic clearance a fourth value indicating a p-value for a decrease is provided. Typically 4000 samples were used for the Bayesian analysis, such that a p-value of "0" is equivale to "<0.00025". See Wambaugh et al. (2019) for more details.

Any one chemical compound *may have multiple ionization equilibria* (see Strope et al., 2018) may both for donating or accepting a proton (and therefore changing charge state). If there are multiple equlibria of the same type (donor/accept])the are concatonated by commas.

All species-specific information is initially from experimental measurements. The functions load_sipes2017, load_pradeep2020, and load_dawson2021 may be used to add in silico, structure-based predictions for many thousands of additional compounds to this table.

ckd_epi_eq

CKD-EPI equation for GFR.

Description

Predict GFR from serum creatinine, gender, and age.

Usage

```
ckd_epi_eq(scr, gender, reth, age_years, ckd_epi_race_coeff = FALSE)
```

Arguments

scr Vector of serum creatinine values in mg/dL. gender Vector of genders (either 'Male' or 'Female').

reth Vector of races/ethnicities. Not used unless ckd_epi_race_coeff is TRUE.

age_years Vector of ages in years.

ckd_epi_race_coeff

Whether to use the "race coefficient" in the CKD-EPI equation. Default is

FALSE.

Details

From Levey AS, Stevens LA, Schmid CH, Zhang YL, Castro AF, Feldman HI, et al. A new equation to estimate glomerular filtration rate. Ann Intern Med 2009; 150(9):604-612. doi:10.7326/0003-4819-150-9-200905050-00006

Value

Vector of GFR values in mL/min/1.73m².

concentration_data_Linakis2020

Concentration data involved in Linakis 2020 vignette analysis.

Description

These rat and human TK concentration vs. time (CvT) data are drawn from the CvTdb (Sayre et el., 2020). Concentrations have all been converted to the units of uM. All data are from inhalation studies.

Usage

concentration_data_Linakis2020

Format

A data.frame containing 2142 rows and 16 columns.

| convert_solve_x | convert_solve_x | |
|-----------------|-----------------|--|
| | | |

Description

This function is designed to convert compartment values estimated from one of the HTTK models (e.g. "1compartment) using the solve_model function. It takes the HTTK model output matrix, model name, desired output units, and compound information to perform the conversion default model units to user specified units.

convert_solve_x 131

Usage

```
convert_solve_x(
  model.output.mat,
  model = NULL,
  output.units = NULL,
  MW = NULL,
  vol = NULL,
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  parameters = NULL,
  monitor.vars = NULL,
  suppress.messages = FALSE,
  verbose = FALSE,
  ...
)
```

Arguments

model.output.mat

Matrix of results from HTTK solve_model function.

model Specified model to use in simulation: "pbtk", "3compartment", "3compartmentss",

"1compartment", "schmitt", ...

output units Output units of interest for the compiled components. Defaults to NULL, and

will provide values in model units if unspecified.

MW Molecular weight of substance of interest in g/mole

vol Volume for the target tissue of interest in liters (L). NOTE: Volume should not

be in units of per BW, i.e. "kg".

chem. cas Either the chemical name, CAS number, or the parameters must be specified.

chem. name Either the chemical name, CAS number, or the parameters must be specified.

dtxsid EPA's DSSTox Structure ID. (https://comptox.epa.gov/dashboard) the chem-

ical must be identified by either CAS, name, or DTXSIDs.

parameters A set of model parameters, especially a set that includes MW (molecular weight)

for our conversions.

monitor.vars A vector of character strings indicating the model component variables to re-

tain in the conversion factor table (assuming suppress.messages == FALSE). It should also be noted this option does NOT exclude columns from the input matrix provided in the 'model.output.mat' parameter. (Default is NULL, i.e. conversion factors for all model components are included in the reporting ma-

trix.)

suppress.messages

Whether or not the output messages are suppressed. (Default is FALSE, i.e.

show messages.)

verbose Whether or not to display the full conversion factor table. (Default is FALSE,

i.e. only include rows where the conversion factor is 1.)

convert_units

Other parameters that can be passed to convert_units, e.g. temperature and compound state. See details in convert_units.

Details

The function can be used to convert all compartments to a single unit, only units for a single model compartment, or units for a set of model compartments.

More details on the unit conversion can be found in the documentation for convert_units.

Value

'new.ouput.matrix' A matrix with a column for time (in days), each compartment, and the area under the curve (AUC) and a row for each time point. The compartment and AUC columns are converted from model specified units to user specified units.

'output.units.vector' A vector of character strings providing the model compartments and their corresponding units after convert_solve_x.

Author(s)

Sarah E. Davidson

See Also

convert units

Examples

convert_units

convert_units

Description

This function is designed to accept input units, output units, and the molecular weight (MW) of a substance of interest to then use a table lookup to return a scaling factor that can be readily applied for the intended conversion. It can also take chemical identifiers in the place of a specified molecular weight value to retrieve that value for its own use.

convert_units 133

Usage

```
convert_units(
  input.units = NULL,
  output.units = NULL,
  MW = NULL,
  vol = NULL,
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  parameters = NULL,
  temp = 25,
  liquid.density = 1,
  state = "liquid"
)
```

Arguments

input.units Assigned input units of interest

MW Molecular weight of substance of interest in g/mole

vol Volume for the target tissue of interest in liters (L). NOTE: Volume should not

be in units of per BW, i.e. "kg".

chem. cas Either the chemical name, CAS number, or the parameters must be specified.

chem. name Either the chemical name, CAS number, or the parameters must be specified.

dtxsid EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chem-

ical must be identified by either CAS, name, or DTXSIDs

parameters A set of model parameters, especially a set that includes MW (molecular weight)

for our conversions

temp Temperature for conversions (default = 25 degreees C)

liquid density Density of the specified chemical in liquid state, numeric value, (default 1.0

g/mL).

state Chemical state (gas or default liquid).

Details

If input or output units not contained in the table are queried, it gives a corresponding error message. It gives a warning message about the handling of 'ppmv,' as the function is only set up to convert between ppmv and mass-based units (like mg/m^3 or umol/L) in the context of ideal gases.

convert_units is not directly configured to accept and convert units based on BW, like mg/kg. For this purpose, see scale_dosing.

The function supports a limited set of most relevant units across toxicological models, currently including umol, uM, mg, mg/L, mg/ m^3 or umol/L), and in the context of gases assumed to be ideal, ppmv.

Andersen and Clewell's Rules of PBPK Modeling:

- 1. Check Your Units
- 2. Check Your Units
- 3. Check Mass Balance

Mark Sfeir, John Wambaugh, and Sarah E. Davidson

Examples

```
# MW BPA is 228.29 g/mol
\# 1 \text{ mg/L} \rightarrow 1/228.29*1000 = 4.38 uM
convert_units("mg/L","uM",chem.cas="80-05-7")
# MW Diclofenac is 296.148 g/mol
# 1 uM -> 296.148/1000 = 0.296
convert_units("uM", "mg/L", chem.name="diclofenac")
# ppmv only works for gasses:
try(convert_units("uM","ppmv",chem.name="styrene"))
convert_units("uM", "ppmv", chem.name="styrene", state="gas")
# Compare with https://www3.epa.gov/ceampubl/learn2model/part-two/onsite/ia_unit_conversion.html
# 1 ug/L Toluene -> 0.263 ppmv
convert_units("ug/L","ppmv",chem.name="toluene",state="gas")
# 1 pppmv Toluene, 0.0038 mg/L
convert_units("ppmv","mg/L",chem.name="toluene",state="gas")
MW_pyrene <- get_physchem_param(param='MW', chem.name='pyrene')</pre>
conversion_factor <- convert_units(input.units='mg/L', output.units ='uM',
  MW=MW_pyrene)
calc_mc_oral_equiv(15, parameters=p)
```

create_mc_samples

Create a table of parameter values for Monte Carlo

Description

This is the HTTK master function for creating a data table for use with Monte Carlo methods to simulate parameter uncertainty and variabilit. Each column of the output table corresponds to an HTTK model parameter and each row corresponds to a different random draw (for example, different individuals when considering biological variability). This function call three different key functions to simulate parameter parameter uncertainty and/or variability in one of three ways. First parameters can be varied in an uncorrelated manner using truncated normal distributions by the function monte_carlo. Then, physiological parameters can be varied in a correlated manner according to the Ring et al. (2017) (doi:10.1016/j.envint.2017.06.004) httk-pop approach by the function httkpop_mc. Next, both uncertainty and variability of in vitro HTTK parameters can be

simulated by the function invitro_mc as described by Wambaugh et al. (2019) (doi:10.1093/toxsci/kfz205). Finally, tissue-specific partition coefficients are predicted for each draw using the Schmitt (2008) (doi:10.1016/j.tiv.2007.09.010) method as calibrated to *in vivo* data by Pearce et al. (2017) (doi:10.1007/s1092801795487) and implemented in predict_partitioning_schmitt.

Usage

```
create_mc_samples(
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  parameters = NULL,
  samples = 1000,
  species = "Human",
  suppress.messages = FALSE,
 model = "3compartmentss",
  httkpop = TRUE,
  invitrouv = TRUE,
  calcrb2p = TRUE,
  censored.params = list(),
  vary.params = list(),
  return.samples = FALSE,
  tissue = NULL,
  httkpop.dt = NULL,
  invitro.mc.arg.list = NULL,
  adjusted.Funbound.plasma = NA,
  adjusted.Clint = NA,
  httkpop.generate.arg.list = list(method = "direct resampling"),
  convert.httkpop.arg.list = NULL,
  propagate.invitrouv.arg.list = NULL,
  parameterize.args.list = NULL,
  Caco2.options = NULL
)
```

Arguments

| chem.cas | Chemical Abstract Services Registry Number (CAS-RN) – if parameters is not specified then the chemical must be identified by either CAS, name, or DTXISD |
|------------|---|
| chem.name | Chemical name (spaces and capitalization ignored) – if parameters is not specified then the chemical must be identified by either CAS, name, or DTXISD |
| dtxsid | EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) – if parameters is not specified then the chemical must be identified by either CAS, name, or DTXSIDs |
| parameters | Parameters from the appropriate parameterization function for the model indicated by argument model |
| samples | Number of samples generated in calculating quantiles. |
| species | Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human"). Species must be set to "Human" to run httkpop model. |

suppress.messages

Whether or not to suppress output message.

model Model used in calculation: 'pbtk' for the multiple compartment model, '3compartment'

for the three compartment model, '3compartmentss' for the three compartment steady state model, and '1compartment' for one compartment model. This only applies when httkpop=TRUE and species="Human", otherwise '3compart-

mentss' is used.

httkpop Whether or not to use the Ring et al. (2017) "httkpop" population generator.

Species must be 'Human'.

invitrouv Logical to indicate whether to include in vitro parameters such as intrinsic hep-

atic clearance rate and fraction unbound in plasma in uncertainty and variability

analysis

calcrb2p Logical determining whether or not to recalculate the chemical ratio of blood to

plasma

censored.params

The parameters listed in censored params are sampled from a normal distribution that is censored for values less than the limit of detection (specified separately for each parameter). This argument should be a list of sub-lists. Each sublist is named for a parameter in "parameters" and contains two elements: "CV" (coefficient of variation) and "LOD" (limit of detection, below which parameter values are censored. New values are sampled with mean equal to the value in "parameters" and standard deviation equal to the mean times the CV. Censored values are sampled on a uniform distribution between 0 and the limit

of detection. Not used with httkpop model.

vary.params The parameters listed in vary.params are sampled from a normal distribution that

is truncated at zero. This argument should be a list of coefficients of variation (CV) for the normal distribution. Each entry in the list is named for a parameter in "parameters". New values are sampled with mean equal to the value in "parameters" and standard deviation equal to the mean times the CV. Not used with

httkpop model.

return.samples Whether or not to return the vector containing the samples from the simulation

instead of the selected quantile.

tissue Desired steady state tissue conentration.

httkpop.dt A data table generated by httkpop_generate. This defaults to NULL, in which

case httkpop_generate is called to generate this table.

invitro.mc.arg.list

Additional parameters passed to invitro_mc.

adjusted.Funbound.plasma

Deprecated argument – use parameterize.args.list

adjusted.Clint Deprecated argument – use parameterize.args.list

httkpop.generate.arg.list

Additional parameters passed to httkpop_generate.

convert.httkpop.arg.list

Additional parameters passed to the convert_httkpop_* function for the model.

propagate.invitrouv.arg.list

Additional parameters passed to model's associated in vitro uncertainty and variability propagation function

parameterize.args.list

Additional parameters passed to the parameterize_* function for the model.

Caco2.options

Arguments describing how to handle Caco2 absorption data that are passed to invitro_mc and the parameterize_[MODEL] functions. See get_fbio for further details.

Details

The Monte Carlo methods used here were recently updated and described by Breen et al. (2022).

We aim to make any function that uses chemical identifiers (name, CAS, DTXSID) also work if passed a complete vector of parameters (that is, a row from the table generated by this function). This allows the use of Monte Carlo to vary the parameters and therefore vary the function output. Depending on the type of parameters (for example, physiological vs. in vitro measurements) we vary the parameters in different ways with different functions.

NOTE: This function calculates oral bioavailability parameters based on Caco2 data. If you are comparing the output of this function to the output of a model-parameterization function 'parameterize_MODEL()', you will need to to ensure that 'parameterize_MODEL()' also uses Caco2 data. The built-in model parameterization functions default to using *in vivo* oral bioavailability data when available. To force them to use Caco2 data instead, please pass the following argument to 'parameterize_MODEL()': 'Caco2.options = list(overwrite.invivo = TRUE'.

Value

A data table where each column corresponds to parameters needed for the specified model and each row represents a different Monte Carlo sample of parameter values.

Examples

```
# We can use the Monte Carlo functions by passing a table
# where each row represents a different Monte Carlo draw of parameters:
p <- create_mc_samples(chem.cas="80-05-7")</pre>
# Use data.table for steady-state plasma concentration (Css) Monte Carlo:
calc_mc_css(parameters=p)
# Using the same table gives the same answer:
calc_mc_css(parameters=p)
# Use Css for 1 mg/kg/day for simple reverse toxicokinetics
# in Vitro-In Vivo Extrapolation to convert 15 uM to mg/kg/day:
15/calc_mc_css(parameters=p, output.units="uM")
# Can do the same with calc_mc_oral_equiv:
calc_mc_oral_equiv(15, parameters=p)
#Generate a population using the virtual-individuals method,
#including 80 females and 20 males,
#including only ages 20-65,
#including only Mexican American and
#Non-Hispanic Black individuals,
#including only non-obese individuals
set.seed(42)
mypop <- httkpop_generate(method = 'virtual individuals',</pre>
                          gendernum=list(Female=80,
                          Male=20),
                           agelim_years=c(20,65),
                           reths=c('Mexican American',
                           'Non-Hispanic Black'),
                           weight_category=c('Underweight',
                           'Normal',
                           'Overweight'))
# Including a httkpop.dt argument will overwrite the number of sample and
# the httkpop on/off logical switch:
samps1 <- create_mc_samples(chem.name="bisphenola",</pre>
                            httkpop=FALSE,
                            httkpop.dt=mypop)
samps2 <- create_mc_samples(chem.name="bisphenola",</pre>
                           httkpop.dt=mypop)
# But we can turn httkpop off altogether if desired:
samps3 <- create_mc_samples(chem.name="bisphenola",</pre>
                           httkpop=FALSE)
```

| 2023 | dawson2023 | Machine Learning PFAS Half-Life Predictions from Dawson et al. 2023 |
|------|------------|---|
|------|------------|---|

Description

Dawson et al. (2023) Supplemental Information S3 includes half-life predictions for 6603 PFAS, of which 3890 are estimated to be within the applicability domain (AD) for humans. This machine learning (ML) model predicts PFAS half-life as one of four categories. The ML model was trained to a dataset of 91 in vivo measured TK half-lives across 11 PFAS, 4 species, and two sexes. Predictions were a function of compound-specific physico-chemical descriptors, species-specific physiological descriptors, and an indicator variable for sex. The kinetics of PFAS are thought to be complicated by active transport, both through either proximal tubular resorption (into the blood) (Andersen et al. 2006) or secretion (into the urine) (Kudo et al. 2002). The ML model uses several species- and structure-derived surrogates for estimating the likelihood of active PFAS transport. Geometry of the proximal tubule was a surrogate for transporter expression: since secretion/resorption transporters line the surface of the proximal tubule, the amount of surface area provides an upper limit on the amount of transporter expression. PFAS similarity to three distinct endogenous ligands was considered as a surrogate for transporter affinity.

Usage

dawson2023

Format

data.frame

Details

The Dawson et al. (2023) half-life categories are:

| Category | Range of Half-Lives |
|----------|---------------------|
| 1 | < 12 hours |
| 2 | < 1 week |
| 3 | < 2 months |
| 4 | > 2 months |

The data frame contains the following columns:

| Column Name | Description |
|---------------|--|
| DTXSID | CompTox Chemicals Dashboard substance identifier |
| Species | Species for which the prediction was made |
| Sex | Sex for which the prediction was made |
| DosingAdj | Route of dose administration – intravenous, oral, or other |
| ClassPredFull | The predicted half-life class (category) |

EPA.ref

dtxsid_id_check

DTXSID number format check function

Description

This function checks whether the DTXSID chemical identifier follows the anticipated format of "DTXSID<uniqueID>".

Usage

```
dtxsid_id_check(dtxsid)
```

Arguments

dtxsid

A character string, or vector of character strings, indicating DTXSID number.

Value

Logical output (TRUE or FALSE) indicating whether the character string(s) provided match the anticipated format for a DTXSID chemical identifier.

EPA.ref

Reference for EPA Physico-Chemical Data

Description

The physico-chemical data in the chem.phys_and_invitro.data table are obtained from EPA's Comptox Chemicals dashboard. This variable indicates the date the Dashboard was accessed.

Usage

EPA.ref

Format

An object of class character of length 1.

estimate_gfr 143

Predict GFR.

Description

Predict GFR using CKD-EPI equation (for adults) or BSA-based equation (for children).

Usage

```
estimate_gfr(gfrtmp.dt, gfr_resid_var = TRUE, ckd_epi_race_coeff = FALSE)
```

Arguments

 ${\tt gfrtmp.dt} \qquad \qquad {\tt A \ data.table \ with \ columns \ gender, \ reth, \ age_years, \ age_months, \ BSA_adj,}$

serum_creat.

gfr_resid_var Logical value indicating whether or not to include residual variability when gen-

erating GFR values. (Default is TRUE.)

ckd_epi_race_coeff

Logical value indicating whether or not to use the "race coefficient" from the

CKD-EPI equation when estimating GFR values. (Default is FALSE.)

Details

Add residual variability based on reported residuals for each equation.

Value

The same data.table with a gfr_est column added, containing estimated GFR values.

Author(s)

Caroline Ring

144 estimate_hematocrit

estimate_gfr_ped

Predict GFR in children.

Description

BSA-based equation from Johnson et al. 2006, Clin Pharmacokinet 45(9) 931-56. Used in Wetmore et al. 2014.

Usage

```
estimate_gfr_ped(BSA)
```

Arguments

BSA

Vector of body surface areas in m².

Value

Vector of GFRs in mL/min/1.73m².

Author(s)

Caroline Ring

References

Ring CL, Pearce RG, Setzer RW, Wetmore BA, Wambaugh JF (2017). "Identifying populations sensitive to environmental chemicals by simulating toxicokinetic variability." *Environment International*, **106**, 105–118. doi:10.1016/j.envint.2017.06.004.

estimate_hematocrit

Generate hematocrit values for a virtual population

Description

Predict hematocrit from age using smoothing splines and kernel density estimates of residual variability fitted to NHANES data, for a given combination of gender and NHANES race/ethnicity category.

Usage

```
estimate_hematocrit(gender, reth, age_years, age_months, nhanes_mec_svy)
```

example.seem 145

Arguments

| gender | Gender for which to generate hematocrit values ("Male" or "Female") |
|----------------|---|
| reth | NHANES race/ethnicity category for which to generate serum creatinine values ("Mexican American", "Non-Hispanic Black", "Non-Hispanic White", "Other", or "Other Hispanic") |
| age_years | Vector of ages in years for individuals for whom to generate hematocrit values (corresponding to age_months) |
| age_months | vector of ages in months for individuals for whom to generate hematocrit values (between 0-959 months) $$ |
| nhanes_mec_svy | <pre>surveydesign object created from mecdt using svydesign (this is done in httkpop_generate)</pre> |

Details

This function should usually not be called directly by the user. It is used by httkpop_generate() in "virtual-individuals" mode, after drawing gender, NHANES race/ethnicity category, and age from their NHANES proportions/distributions.

Value

A vector of numeric generated hematocrit values (blood percentage red blood cells by volume).

Author(s)

Caroline Ring

References

example.toxcast

ToxCast Example Data The main page for the ToxCast data is here: https://www.epa.gov/comptox-tools/exploring-toxcast-data Most useful to us is a single file containing all the hits across all chemcials and assays: https://clowder.edap-cluster.com/datasets/6364026ee4b04f6bb1409eda?space=62bb560ee4b07abf29f88fef

Description

As of November, 2022 the most recent version was 3.5 and was available as an .Rdata file (invit-rodb_3_5_mc5.Rdata)

Usage

example.toxcast

Format

data.frame

Details

Unfortunately for this vignette there are too many ToxCast data to fit into a 5mb R package. So we will subset to just the shemicals for the "Intro to IVIVE" vignette and distribute only those data. In addition, out of 78 columns in the data, we will keep only eight.

export_pbtk_jarnac 147

export_pbtk_jarnac

Export model to jarnac.

Description

This function exports the multiple compartment PBTK model to a jarnac file.

Usage

```
export_pbtk_jarnac(
  chem.cas = NULL,
  chem.name = NULL,
  species = "Human",
  initial.amounts = list(Agutlumen = 0),
  folder = tempdir(),
  filename = "default.jan",
  digits = 4
)
```

Arguments

chem. cas Either the chemical name or CAS number must be specified. chem. name Either the chemical name or CAS number must be specified.

species Species desired (either "Rat", "Rabbit", "Dog", or default "Human").

initial.amounts

Must specify initial amounts in units of choice.

folder The folder on the file system containing the output file. Defaults to tempdir.

filename The name of the jarnac file containing the model.

digits Desired number of decimal places to round the parameters.

Details

Compartments to enter into the initial.amounts list includes Agutlumen, Aart, Aven, Alung, Agut, Aliver, Akidney, and Arest.

When species is specified as rabbit, dog, or mouse, the function uses the appropriate physiological data(volumes and flows) but substitues human fraction unbound, partition coefficients, and intrinsic hepatic clearance.

Value

Text containing a Jarnac language version of the PBTK model.

Author(s)

Robert Pearce

148 export_pbtk_sbml

Examples

```
export_pbtk_jarnac(chem.name='Nicotine',initial.amounts=list(Agutlumen=1),filename='PBTKmodel.jan')
```

export_pbtk_sbml

Export model to sbml.

Description

This function exports the multiple compartment PBTK model to an sbml file.

Usage

```
export_pbtk_sbml(
  chem.cas = NULL,
  chem.name = NULL,
  species = "Human",
  initial.amounts = list(Agutlumen = 0),
  filename = "default.xml",
  folder = tempdir(),
  digits = 4
)
```

Arguments

chem. cas Either the chemical name or CAS number must be specified.

chem. name Either the chemical name or CAS number must be specified.

species Species desired (either "Rat", "Rabbit", "Dog", or default "Human").

initial.amounts

Must specify initial amounts in units of choice.

filename The name of the jarnac file containing the model.

folder The folder on the file system containing the output file. Defaults to tempdir.

digits Desired number of decimal places to round the parameters.

Details

Compartments to enter into the initial.amounts list includes Agutlumen, Aart, Aven, Alung, Agut, Aliver, Akidney, and Arest.

When species is specified as rabbit, dog, or mouse, the function uses the appropriate physiological data(volumes and flows) but substitues human fraction unbound, partition coefficients, and intrinsic hepatic clearance.

fetalpcs 149

Value

Text describing the PBTK model in SBML.

Author(s)

Robert Pearce

Examples

export_pbtk_sbml(chem.name='Nicotine',initial.amounts=list(Agutlumen=1),filename='PBTKmodel.xml')

fetalpcs

Fetal Partition Coefficients

Description

Partition coefficients were measured for tissues, including placenta, in vitro by Csanady et al. (2002) for Bisphenol A and Diadzen. Curley et al. (1969) measured the concentration of a variety of pesticides in the cord blood of newborns and in the tissues of infants that were stillborn.

Usage

fetalpcs

Format

data.frame

Details

Three of the chemicals studied by Curley et al. (1969) were modeled by Weijs et al. (2013) using the same partition coefficients for mother and fetus. The values used represented "prior knowledge" summarizing the available literature.

gen_age_height_weight Generate demographic parameters for a virtual population

Description

Generate gender, NHANES race/ethnicity category, ages, heights, and weights for a virtual population, based on NHANES data.

Usage

```
gen_age_height_weight(
  nsamp = NULL,
  gendernum = NULL,
  reths,
 weight_category,
  agelim_years,
  agelim_months,
  nhanes_mec_svy
)
```

Arguments

nsamp

The desired number of individuals in the virtual population. nsamp need not be

provided if gendernum is provided.

gendernum

Optional: A named list giving the numbers of male and female individuals to include in the population, e.g. list(Male=100, Female=100). Default is NULL, meaning both males and females are included, in their proportions in the NHANES data. If both nsamp and gendernum are provided, they must agree

(i.e., nsamp must be the sum of gendernum).

reths

Optional: a character vector giving the races/ethnicities to include in the population. Default is c('Mexican American', 'Other Hispanic', 'Non-Hispanic White', 'Non-Hispanic Black', 'Other'), to include all races and ethnicities in their proportions in the NHANES data. User-supplied vector must contain one or more of these strings.

weight_category

Optional: The weight categories to include in the population. Default is c('Underweight', 'Normal', 'Overweight', 'Obese'). User-supplied vector must contain one

or more of these strings.

agelim_years

Optional: A two-element numeric vector giving the minimum and maximum ages (in years) to include in the population. Default is c(0.79). If agelim_years is provided and agelim_months is not, agelim_years will override the default value of agelim_months.

agelim_months

Optional: A two-element numeric vector giving the minimum and maximum ages (in months) to include in the population. Default is c(0, 959), equivalent to the default agelim_years. If agelim_months is provided and agelim_years is not, agelim_months will override the default values of agelim_years.

gen_height_weight

nhanes_mec_svy surveydesign object created from mecdt using svydesign (this is done in httkpop_generate)

Details

This function should usually not be called directly by the user. It is used by httkpop_generate() in "virtual-individuals" mode.

Value

gender Gender of each virtual individual
reth Race/ethnicity of each virtual individual
age_months Age in months of each virtual individual
age_years Age in years of each virtual individual
weight Body weight in kg of each virtual individual

height Height in cm of each virtual individual

A data.table containing variables

Author(s)

Caroline Ring

References

Ring CL, Pearce RG, Setzer RW, Wetmore BA, Wambaugh JF (2017). "Identifying populations sensitive to environmental chemicals by simulating toxicokinetic variability." *Environment International*, **106**, 105–118. doi:10.1016/j.envint.2017.06.004.

importFrom survey svymean

gen_height_weight

Generate heights and weights for a virtual population.

Description

Predict height and weight from age using smoothing splines, and then add residual variability from a 2-D KDE, both fitted to NHANES data, for a given combination of gender and NHANES race/ethnicity category.

Usage

```
gen_height_weight(gender, reth, age_months, nhanes_mec_svy)
```

gen_serum_creatinine 153

Arguments

gender Gender for which to calculate height/weight ("Male" or "Female")

reth NHANES race/ethnicity category for which to calculate height/weight ("Mex-

ican American", "Non-Hispanic Black", "Non-Hispanic White", "Other", or

"Other Hispanic")

age_months vector of ages in months for individuals for whom to calculate height/weight

(between 0-959 months)

nhanes_mec_svy surveydesign object created from mecdt using svydesign (this is done in

httkpop_generate)

Details

This function should usually not be called directly by the user. It is used by httkpop_generate() in "virtual-individuals" mode, after drawing gender, NHANES race/ethnicity category, and age from their NHANES proportions/distributions.

Value

A list containing two named elements, weight and height, each of which is a numeric vector. weight gives individual body weights in kg, and height gives individual heights in cm, corresponding to each item in the input age_months.

Author(s)

Caroline Ring

gen_serum_creatinine Generate serum creatinine values for a virtual population.

Description

Predict serum creatinine from age using smoothing splines and kernel density estimates of residual variability fitted to NHANES data,, for a given combination of gender and NHANES race/ethnicity category.

Usage

```
gen_serum_creatinine(gender, reth, age_years, age_months, nhanes_mec_svy)
```

154 get_2023pfasinfo

Arguments

| gender | Gender for which to generate serum creatinine values ("Male" or "Female") |
|----------------|---|
| reth | NHANES race/ethnicity category for which to generate serum creatinine values ("Mexican American", "Non-Hispanic Black", "Non-Hispanic White", "Other", or "Other Hispanic") |
| age_years | Vector of ages in years for individuals for whom to generate serum creatinine values (corresponding to age_months) |
| age_months | vector of ages in months for individuals for whom to generate serum creatinine values (between 0-959 months) $$ |
| nhanes_mec_svy | surveydesign object created from $mecdt$ using $svydesign$ (this is done in $httkpop_generate$) |

Details

This function should usually not be called directly by the user. It is used by httkpop_generate() in "virtual-individuals" mode, after drawing gender, NHANES race/ethnicity category, and age from their NHANES proportions/distributions.

Value

A vector of numeric generated serum creatinine values (mg/dL).

Author(s)

Caroline Ring

| get_2023pfasinfo | Retrieve chemical information on 2023 EPA PFAS Chemicals |
|------------------|--|
| • | y . |

Description

This function is a wrapper for get_cheminfo that only lists chemicals from the Smeltz, Kreutz, and Crizer data sets collected on PFAS between 2019 and 2022. Plasma protein binding (fraction unbound) data were collected using ultracentrifugation (UC) instead of rapid equilibrium dialysis. Intrisinsic hepatic clearance (Clint) data were collected with substrate depletion (over time) assays.

get_2023pfasinfo 155

Usage

```
get_2023pfasinfo(
  info = "CAS",
  species = "Human",
  fup.lod.default = 0.005,
  model = "3compartmentss",
  default.to.human = FALSE,
  median.only = FALSE,
  fup.ci.cutoff = FALSE,
  clint.pvalue.threshold = 0.05,
  suppress.messages = FALSE
)
```

Arguments

info A single character vector (or collection of character vectors) from "Compound",

"CAS", "DTXSID, "logP", "pKa_Donor"," pKa_Accept", "MW", "Clint", "Clint.pValue",

"Funbound.plasma", "Structure_Formula", or "Substance_Type". info="all" gives

all information for the model and species.

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

fup.lod.default

Default value used for fraction of unbound plasma for chemicals where mea-

sured value was below the limit of detection. Default value is 0.0005.

Model used in calculation, 'pbtk' for the multiple compartment model, '1com-

partment' for the one compartment model, '3compartment' for three compartment model, '3compartmentss' for the three compartment model without partition coefficients, or 'schmitt' for chemicals with logP and fraction unbound

(used in predict_partitioning_schmitt).

default.to.human

Substitutes missing values with human values if true.

median.only Use median values only for fup and clint. Default is FALSE.

fup.ci.cutoff Cutoff for the level of uncertainty in fup estimates. This value should be between

(0,1). Default is 'NULL' specifying no filtering.

clint.pvalue.threshold

Hepatic clearance for chemicals where the in vitro clearance assay result has a

p-values greater than the threshold are set to zero.

suppress.messages

Whether or not the output messages are suppressed.

Details

Note that in some cases the **Funbound.plasma** and the **intrinsic clearance** are *provided as a series* of numbers separated by commas. These values are the result of Bayesian analysis and characterize a distribution: the first value is the median of the distribution, while the second and third values are the lower and upper 95th percentile (that is qunatile 2.5 and 97.5) respectively. For intrinsic clearance a fourth value indicating a p-value for a decrease is provided. Typically 4000 samples

get_2023pfasinfo

were used for the Bayesian analusis, such that a p-value of "0" is equivale to "<0.00025". See Wambaugh et al. (2019) for more details. If argument meadian.only == TRUE then only the median is reported for parameters with Bayesian analysis distributions. If the 95 credible interval is larger than fup.ci.cutoff (defaults to NULL) then the Fup is treated as too uncertain and the value NA is given.

Value

vector/data.table

Table (if info has multiple entries) or vector containing a column for each valid entry specified in the argument "info" and a row for each chemical with sufficient data for the model specified by argument "model":

| Column | Description | units |
|---------------------------|---|-------------------------|
| Compound | The preferred name of the chemical compound | none |
| CAS | The preferred Chemical Abstracts Service Registry Number | none |
| DTXSID | DSSTox Structure ID (http://comptox.epa.gov/dashboard) | none |
| logP | The log10 octanol:water partition coefficient | log10 unitless ratio |
| MW | The chemical compound molecular weight | g/mol |
| pKa_Accept | The hydrogen acceptor equilibria concentrations | logarithm |
| pKa_Donor | The hydrogen donor equilibria concentrations | logarithm |
| [SPECIES].Clint | (Primary hepatocyte suspension) intrinsic hepatic clearance | uL/min/10^6 hepatocytes |
| [SPECIES].Clint.pValue | Probability that there is no clearance observed. | none |
| [SPECIES].Funbound.plasma | Chemical fraction unbound in presence of plasma proteins | unitless fraction |
| [SPECIES].Rblood2plasma | Chemical concentration blood to plasma ratio | unitless ratio |

Author(s)

John Wambaugh

Examples

get_caco2 157

get_caco2

Retrieve in vitro measured Caco-2 membrane permeabilit

Description

This function checks for chemical-specific in vitro measurements of the Caco-2 membrane permeability in the chem.physical_and_invitro.data table. If no value is available argument Caco2.Pab.default is returned. Anywhere that the values is reported by three numbers separated by a comma (this also happens for plasma protein binding) the three values are: median, lower 95 percent confidence intervals, upper 95 percent confidence interval. Unless you are doing monte carlo work it makes sense to ignore the second and third values.

Usage

```
get_caco2(
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  Caco2.Pab.default = 1.6,
  suppress.messages = FALSE
)
```

Arguments

| chem.cas | Chemical Abstract Services Registry Number (CAS-RN) – the chemical must be identified by either CAS, name, or DTXISD | |
|-------------------|---|--|
| chem.name | Chemical name (spaces and capitalization ignored) – the chemical must be identified by either CAS, name, or DTXISD | |
| dtxsid | EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) – the chemical must be identified by either CAS, name, or DTXSIDs | |
| Caco2.Pab.default | | |
| | sets the default value for Caco2.Pab if Caco2.Pab is unavailable. | |
| suppress.messages | | |
| | Whether or not the output message is suppressed. | |

Author(s)

158 get_cheminfo

get_cheminfo

Retrieve chemical information available from HTTK package

Description

This function lists information on all the chemicals within HTTK for which there are sufficient data for the specified model and species. By default the function returns only CAS (that is, info="CAS"). The type of information available includes chemical identifiers ("Compound", "CAS", "DTXSID"), in vitro measurements ("Clint", "Clint.pvalue", "Funbound plasma", "Rblood2plasma"), and physicochemical information ("Formula", "logMA", "logP", "MW", "pKa_Accept", "pKa_Donor"). The argument "info" can be a single type of information, "all" information, or a vector of specific types of information. The argument "model" defaults to "3compartmentss" and the argument "species" defaults to "human". Since different models have different requirements and not all chemicals have complete data, this function will return different numbers of chemicals depending on the model specified. If a chemical is not listed by get_cheminfo then either the in vitro or physico-chemical data needed are currently missing (but could potentially be added using add_chemtable.

Usage

```
get_cheminfo(
  info = "CAS",
  species = "Human",
  fup.lod.default = 0.005,
  model = "3compartmentss",
  default.to.human = FALSE,
  median.only = FALSE,
  fup.ci.cutoff = TRUE,
  clint.pvalue.threshold = 0.05,
  physchem.exclude = TRUE,
  class.exclude = TRUE,
  suppress.messages = FALSE
)
```

Arguments

mode1

info A single character vector (or collection of character vectors) from "Compound",

"CAS", "DTXSID, "logP", "pKa_Donor"," pKa_Accept", "MW", "Clint", "Clint.pValue",

"Funbound.plasma", "Structure_Formula", or "Substance_Type". info="all" gives

all information for the model and species.

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

fup.lod.default

Default value used for fraction of unbound plasma for chemicals where mea-

sured value was below the limit of detection. Default value is 0.0005.

Model used in calculation, 'pbtk' for the multiple compartment model, '1compartment' for the one compartment model, '3compartment' for three compartment model, '3compartmentss' for the three compartment model without par-

get_cheminfo 159

tition coefficients, or 'schmitt' for chemicals with logP and fraction unbound (used in predict_partitioning_schmitt).

default.to.human

Substitutes missing values with human values if true.

median.only Use median values only for fup and clint. Default is FALSE.

fup.ci.cutoff Boolean eliminating uncertain fup estimates. If TRUE, fup values whose 95

spans 0.1 to 0.9 (or more) are eliminated. (Default value is TRUE.)

clint.pvalue.threshold

Hepatic clearance for chemicals where the in vitro clearance assay result has a p-values greater than the threshold are set to zero.

physchem.exclude

Exclude chemicals on the basis of physico-chemical properties (currently only Henry's law constant) as specified by the relevant modelinfo_[MODEL] file (default TRUE).

class.exclude Exclude chemical classes identified as outside of domain of applicability by the relevant modelinfo_[MODEL] file (default TRUE).

suppress.messages

Whether or not the output messages are suppressed (default FALSE).

Details

When default.to.human is set to TRUE, and the species-specific data, Funbound.plasma and Clint, are missing from chem.physical_and_invitro.data, human values are given instead.

In some cases the rapid equilibrium dialysis method (Waters et al., 2008) fails to yield detectable concentrations for the free fraction of chemical. In those cases we assume the compound is highly bound (that is, Fup approaches zero). For some calculations (for example, steady-state plasma concentration) there is precedent (Rotroff et al., 2010) for using half the average limit of detection, that is, 0.005 (this value is configurable via the argument fup.lod.default). We do not recommend using other models where quantities like partition coefficients must be predicted using Fup. We also do not recommend including the value 0.005 in training sets for Fup predictive models.

Note that in some cases the **Funbound.plasma** (fup) and the **intrinsic clearance** (clint) are *provided as a series of numbers separated by commas*. These values are the result of Bayesian analysis and characterize a distribution: the first value is the median of the distribution, while the second and third values are the lower and upper 95th percentile (that is quantile 2.5 and 97.5) respectively. For intrinsic clearance a fourth value indicating a p-value for a decrease is provided. Typically 4000 samples were used for the Bayesian analysis, such that a p-value of "0" is equivalent to "<0.00025". See Wambaugh et al. (2019) for more details. If argument median.only == TRUE then only the median is reported for parameters with Bayesian analysis distributions. If the 95 credible interval spans the range of 0.1 to 0.9 and fup.ci.cutoff is set to TRUE, i.e., the default setting, then the Fup is treated as too uncertain and the value NA is given.

Value

vector/data.table

Table (if info has multiple entries) or vector containing a column for each valid entry specified in the argument "info" and a row for each chemical with sufficient data for the model specified by argument "model":

160 get_cheminfo

# rows in the table but just in case we ask for non NA values:
sum(!is.na(fup.tab$Human.Funbound.plasma))
```

get_chem_id

Retrieve chemical identity from HTTK package

Description

Given one of chem.name, chem.cas (Chemical Abstract Service Registry Number), or DTXSID (DSStox Substance Identifier https://comptox.epa.gov/dashboard) this function checks if the chemical is available and, if so, returns all three pieces of information.

Usage

```
get_chem_id(chem.cas = NULL, chem.name = NULL, dtxsid = NULL)
```

Arguments

chem.cas CAS regstry number chem.name Chemical name

dtxsid DSSTox Substance identifier

162 get_clint

Value

A list containing the following chemical identifiers:

chem.cas CAS registry number

chem.name Name dtxsid DTXSID

Author(s)

John Wambaugh and Robert Pearce

get_clint

Retrieve and parse intrinsic hepatic clearance

Description

This function retrieves the chemical- and species-specific intinsic hepatic clearance $(Cl_{int},$ inits of uL/min/million hepatocytes) from chem.physical_and_invitro.data. If that parameter is described by a distribution (that is, a median, lower-, upper-95th percentile and p-value separated by commas) this function splits those quantiles into separate values. Most Cl_{int} values have an accompanying p-value indicating the probability that no decrease was observed. If the p-values exceeds a threhsold (default 0.05) the clearance is set to zero (no clearance). Some values extracted from the literature do not have a p-value.

Usage

```
get_clint(
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  species = "Human",
  default.to.human = FALSE,
  force.human.clint = FALSE,
  suppress.messages = FALSE,
  clint.pvalue.threshold = 0.05
)
```

Arguments

| chem.cas | Chemical Abstract Services Registry Number (CAS-RN) – if parameters is not specified then the chemical must be identified by either CAS, name, or DTXISD |
|-----------|---|
| chem.name | Chemical name (spaces and capitalization ignored) – if parameters is not specified then the chemical must be identified by either CAS, name, or DTXISD |
| dtxsid | EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) – if parameters is not specified then the chemical must be identified by either CAS, name, or DTXSIDs |

get_fbio 163

```
species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human"). default.to.human
```

Substitutes missing hepatic clearance with human values if true.

force.human.clint

If a non-human species value (matching argument species) is available, it is ignored and the human intrinsic clearance is used

suppress.messages

Whether or not the output message is suppressed.

clint.pvalue.threshold

Hepatic clearance for chemicals where the in vitro clearance assay result has a p-values greater than the threshold are set to zero.

Value

list containing:

CLint.point Point estimate (central tendency) of the intrinsic hepatic clearance

Clint.dist Quantiles of a distribution (median, lower, upper 95th percentiles) and pvalue

Clint.pvalue pvalue for whether disapperance of parent compound was observed

Author(s)

John Wambaugh

get_fbio

Retrieve or calculate fraction of chemical absorbed from the gut

Description

This function checks for chemical-specific in vivo measurements of the fraction absorbed from the gut in the chem.physical_and_invitro.data table. If in vivo data are unavailable (or keepit100 == TRUE) we attempt to use in vitro Caco-2 membrane permeability to predict the fractions according to calc_fbio.oral.

Usage

```
get_fbio(
  parameters = NULL,
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  species = "Human",
  Caco2.Pab.default = 1.6,
```

164 get_fbio

```
Caco2.Fgut = TRUE,
Caco2.Fabs = TRUE,
overwrite.invivo = FALSE,
keepit100 = FALSE,
suppress.messages = FALSE,
...
)
```

Arguments

| parameters | A list of the parameters (Caco2.Pab, Funbound.Plasma, Rblood2plasma, Clint, BW, Qsmallintestine, Fabs, Fgut) used in the calculation, either supplied by user or calculated in parameterize_steady_state. |
|-------------------|---|
| chem.cas | Chemical Abstract Services Registry Number (CAS-RN) – the chemical must be identified by either CAS, name, or DTXISD |
| chem.name | Chemical name (spaces and capitalization ignored) – the chemical must be identified by either CAS, name, or DTXISD |
| dtxsid | EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) – the chemical must be identified by either CAS, name, or DTXSIDs |
| species | Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human"). |
| Caco2.Pab.default | |
| | sets the default value for Caco2.Pab if Caco2.Pab is unavailable. |
| Caco2.Fgut | = TRUE uses Caco2.Pab to calculate fgut.oral, otherwise fgut.oral = Fgut. |
| Caco2.Fabs | = TRUE uses Caco2.Pab to calculate fabs.oral, otherwise fabs.oral = Fabs. |
| overwrite.invi | vo |
| | = TRUE overwrites Fabs and Fgut in vivo values from literature with Caco2 derived values if available. |
| keepit100 | TRUE overwrites Fabs and Fgut with 1 (i.e. 100 percent) regardless of other settings. |
| suppress.messages | |
| | Whether or not the output message is suppressed. |
| | Additional parameters passed to parameterize function if parameters is NULL. |

get_fup 165

get_fup

Retrieve and parse fraction unbound in plasma

Description

This function retrieves the chemical- and species-specific fraction unbound in plasma (f_{up}) from chem.physical_and_invitro.data. If that parameter is described by a distribution (that is, a median, lower-, and upper-95th percentile separated by commas) this function splits those quantiles into separate values.

Usage

```
get_fup(
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  species = "Human",
  default.to.human = FALSE,
  force.human.fup = FALSE,
  suppress.messages = FALSE,
  minimum.Funbound.plasma = 1e-04
)
```

Arguments

| chem.cas | Chemical Abstract Services Registry Number (CAS-RN) – if parameters is not specified then the chemical must be identified by either CAS, name, or DTXISD | |
|-------------------------|---|--|
| chem.name | Chemical name (spaces and capitalization ignored) – if parameters is not specified then the chemical must be identified by either CAS, name, or DTXISD | |
| dtxsid | EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) – if parameters is not specified then the chemical must be identified by either CAS, name, or DTXSIDs | |
| species | Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human"). | |
| default.to.human | | |
| | Substitutes missing fraction of unbound plasma with human values if true. | |
| force.human.fup | | |
| | If a non-human species value (matching argument species) is available, it is ignored and the human fraction unbound is returned | |
| suppress.messages | | |
| | Whether or not the output message is suppressed. | |
| minimum.Funbound.plasma | | |
| | f_{up} is not allowed to drop below this value (default is 0.0001). | |

166 get_gfr_category

Value

list containing:

Funbound.plasma.point

Point estimate (central tendency) of the Unbound fraction in plasma

Funbound.plasma.dist

Quantiles of a distribution (median, lower and upper 95th percentiles) for the unbound fraction

Author(s)

John Wambaugh

See Also

```

get_gfr_category

Categorize kidney function by GFR.

Description

For adults: In general GFR > 60 is considered normal 15 < GFR < 60 is considered kidney disease GFR < 15 is considered kidney failure

Usage

```
get_gfr_category(age_years, age_months, gfr_est)
```

Arguments

age_years Vector of ages in years.

age_months Vector of ages in months.

gfr_est Vector of estimated GFR values in mL/min/1.73m^2.

Details

These values can also be used for children 2 years old and greater (see PEDIATRICS IN REVIEW Vol. 29 No. 10 October 1, 2008 pp. 335-341 (doi: 10.1542/pir.29-10-335))

Value

Vector of GFR categories: 'Normal', 'Kidney Disease', 'Kidney Failure'.

References

Ring CL, Pearce RG, Setzer RW, Wetmore BA, Wambaugh JF (2017). "Identifying populations sensitive to environmental chemicals by simulating toxicokinetic variability." *Environment International*, **106**, 105–118. doi:10.1016/j.envint.2017.06.004.

```
get_input_param_timeseries
```

Get timeseries containing the change of each of the input parameters.

Description

The deSolve package uses timeseries as forcing functions. In lieu of hard-coding time evolution of parameters into a model, these timeseries may be used to change the value of parameters in time. The function get_input_parm_timeseries queries a virutal population and non-parametrically produces timeseries that preserve the percentile score of the given starting values.

Usage

```
get_input_param_timeseries(
  model,
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  initial.params = NULL,
  initial.percentiles = NULL,
  start.age = 360,
  days = 10,
  ref.params = NULL,
  bandwidth = 12,
  get.median.param.vals = FALSE
)
```

Arguments

| model | The name of a model which can accept timeseries as forcing functions. |
|----------------|--|
| chem.cas | Chemical Abstract Services Registry Number (CAS-RN) – the chemical must be identified by either CAS, name, or DTXISD |
| chem.name | Chemical name (spaces and capitalization ignored) – the chemical must be identified by either CAS, name, or DTXISD |
| dtxsid | EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) – the chemical must be identified by either CAS, name, or DTXSIDs |
| initial.params | The values for each parameter at the beginning of the simulation. All compiled parameters should be present. The output of the parameterize_ <model> function is appropriate for initial.params.</model> |

initial.percentiles

If initial.params are not provided, initial.percentiles will designate a starting value for each parameter according to the corresponding percentile within the NHANES population. Values should be between zero and one. If neither initial.params nor initial.percentiles are provided, the initial value for the parameter is taken to be the median of the population value.

start.age

The age in months of the individual at the beginning of the simulation. Used for determining the percentile score of the initial parameter values when producing the timeseries determining parameter changes.

days

The length of the simulation in days. Equivalent to the days parameter in solve_model.

ref.params

Model parameters of a reference population used in determining timeseries. Recommended column binding ages in months (as age_months) to the output of create_mc_samples.

bandwidth

Dictates the length of time centered around the present to use when calculating non-parametric regressions.

get.median.param.vals

Return, instead of the timeseries, the median values for the dynamic model parameters at the given start age.

Details

For each time-dependent model, there should be a function that determines the model parameter values for each individual in the NHANES dataset. The resulting value are used to form the non-parametric regression curve.

Value

A list of two-column matrices indexed by names of compiled parameters for the designated model. The first column contains a list of times (in days) and the second the total change in that parameter from the initial value.

Examples

get_invitroPK_param 169

Description

This function retrieves in vitro PK data (for example, intrinsic metabolic clearance or fraction unbound in plasma) for the chemical specified by argument "chem.name", "dtxsid", or chem.cas from the table chem.physical_and_invitro.data. This function looks for species-specific values based on the argument "species".

Usage

```
get_invitroPK_param(
  param,
  species,
  chem.name = NULL,
  chem.cas = NULL,
  dtxsid = NULL
```

Arguments

| param | The desired parameters, a vector or single value. |
|-----------|---|
| species | Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human"). |
| chem.name | The chemical names that you want parameters for, a vector or single value |
| chem.cas | The chemical CAS numbers that you want parameters for, a vector or single value |
| dtxsid | EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) |

get_lit_cheminfo

Details

Note that this function works with a local version of the chem.physical_and_invitro.data table to allow users to add/modify chemical data (for example, adding new data via add_chemtable or loading in silico predictions distributed with httk via load_sipes2017, load_pradeep2020, load_dawson2021, or load_honda2023).

User can request via argument param (case-insensitive):

| Parameter | Description |
|---------------------------|---|
| [SPECIES].Clint | (Primary hepatocyte suspension) intrinsic hepatic clearance. Entries with comma separated vo |
| [SPECIES].Clint.pValue | Probability that there is no clearance observed. Values close to 1 indicate clearance is not stat |
| [SPECIES].Caco2.Pab | Caco-2 Apical-to-Basal Membrane Permeability |
| [SPECIES].Fabs | In vivo measured fraction of an oral dose of chemical absorbed from the gut lumen into the gu |
| [SPECIES].Fgut | In vivo measured fraction of an oral dose of chemical that passes gut metabolism and clearance |
| [SPECIES].Foral | In vivo measued fractional systemic bioavailability of an oral dose, modeled as he product of |
| [SPECIES].Funbound.plasma | Chemical fraction unbound in presence of plasma proteins (fup). Entries with comma separat |
| [SPECIES].Rblood2plasma | Chemical concentration blood to plasma ratio |

Value

The parameters, either a single value, a named list for a single chemical, or a list of lists

get_lit_cheminfo

Get literature Chemical Information.

Description

This function provides the information specified in "info=" for all chemicals with data from the Wetmore et al. (2012) and (2013) publications and other literature.

Usage

```
get_lit_cheminfo(info = "CAS", species = "Human")
```

get_lit_css 171

Arguments

info A single character vector (or collection of character vectors) from "Compound",

"CAS", "MW", "Raw. Experimental. Percentage. Unbound", "Entered. Experimental. Percentage. Unbound. "Entered. "Experimental. Percentage. Unbound. "Entered. "Experimental. Percentage. Unbound.", "Entered. "Experimental. Percentage. Unbound. "Entered. "Experimental. Percentage. Unbound.", "Entered. "Experimental. Percentage. Unbound. "Experimental. Percentage. "Experimental. Percentage. "Experimental. Percentage. "Experimental. "E

Examples

```
get_lit_cheminfo()
get_lit_cheminfo(info=c('CAS','MW'))
```

get_lit_css

Get literature Css

Description

This function retrieves a steady-state plasma concentration as a result of infusion dosing from the Wetmore et al. (2012) and (2013) publications and other literature.

get_lit_css

Usage

```
get_lit_css(
  chem.cas = NULL,
  chem.name = NULL,
  daily.dose = 1,
  which.quantile = 0.95,
  species = "Human",
  clearance.assay.conc = NULL,
  output.units = "mg/L",
  suppress.messages = FALSE
)
```

Arguments

chem.cas Either the cas number or the chemical name must be specified. Either the chemical name or the CAS number must be specified. chem.name daily.dose Total daily dose infused in units of mg/kg BW/day. Defaults to 1 mg/kg/day. which quantile Which quantile from the SimCYP Monte Carlo simulation is requested. Can be a vector. Species desired (either "Rat" or default "Human"). species clearance.assay.conc Concentration of chemical used in measureing intrinsic clearance data, 1 or 10 Returned units for function, defaults to mg/L but can also be uM (specify units output.units = "uM"). suppress.messages

Whether or not the output message is suppressed.

Value

A numeric vector with the literature steady-state plasma concentration (1 mg/kg/day) for the requested quantiles

Examples

```
get_lit_css(chem.cas="34256-82-1")
get_lit_css(chem.cas="34256-82-1", species="Rat", which.quantile=0.5)
get_lit_css(chem.cas="80-05-7", daily.dose = 1, which.quantile = 0.5, output.units = "uM")
```

get_lit_oral_equiv

Get Literature Oral Equivalent Dose

Description

This function converts a chemical plasma concetration to an oral equivalent dose using the values from the Wetmore et al. (2012) and (2013) publications and other literature.

Usage

```
get_lit_oral_equiv(
  conc,
  chem.name = NULL,
  chem.cas = NULL,
  dtxsid = NULL,
  suppress.messages = FALSE,
  which.quantile = 0.95,
  species = "Human",
  input.units = "uM",
  output.units = "mg",
  clearance.assay.conc = NULL,
  ...
)
```

Arguments

conc Bioactive in vitro concentration in units of specified input.units, default of uM.

chem. name Either the chemical name or the CAS number must be specified.

chem. cas Either the CAS number or the chemical name must be specified.

dtxsid EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chem-

ical must be identified by either CAS, name, or DTXSIDs

suppress.messages

Suppress output messages.

174 get_lit_oral_equiv

which quantile Which quantile from the SimCYP Monte Carlo simulation is requested. Can be a vector. Papers include 0.05, 0.5, and 0.95 for humans and 0.5 for rats.

species Species desired (either "Rat" or default "Human").

input.units Units of given concentration, default of uM but can also be mg/L.

output.units Units of dose, default of 'mg' for mg/kg BW/ day or 'mol' for mol/ kg BW/ day.

clearance.assay.conc

Concentration of chemical used in measureing intrinsic clearance data, 1 or 10

uM.

... Additional parameters passed to get_lit_css.

Value

Equivalent dose in specified units, default of mg/kg BW/day.

get_lit_oral_equiv(0.1,chem.cas="34256-82-1",which.quantile=c(0.05,0.5,0.95))</pre>
```

get_physchem_param 175

| get_physchem_param | Get | physico-chemical | parameters | from |
|--------------------|--------------------------------------|------------------|------------|------|
| | chem.physical_and_invitro.data table | | | |
| | | | | |

Description

This function retrieves physico-chemical properties ("param") for the chemical specified by chem.name or chem.cas from the table chem.physical_and_invitro.data. This function is distinguished from get_invitroPK_param in that there are no species-specific values. Physically meaningful values for ionization equilibria are NA/none (that is, no ionization), a single value, or a series of values separated by commas. If logMA (log10 membrane affinity) is NA, we use calc_ma() to predict it later on in the model parameterization functions.

Usage

```
get_physchem_param(param, chem.name = NULL, chem.cas = NULL, dtxsid = NULL)
```

Arguments

| param | The desired parameters, a vector or single value. |
|-----------|--|
| chem.name | The chemical names that you want parameters for, a vector or single value |
| chem.cas | The chemical CAS numbers that you want parameters for, a vector or single value |
| dtxsid | EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chemical must be identified by either CAS, name, or DTXSIDs |

Details

Note that this function works with a local version of the chem.physical_and_invitro.data table to allow users to add/modify chemical data (for example, adding new data via add_chemtable or loading in silico predictions distributed with httk via load_sipes2017, load_pradeep2020, load_dawson2021, or load_honda2023).

User can request the following via argument param (case-insensitive):

| Parameter | Description | Units |
|------------|--|----------------------------------|
| MW | Molecular weight | g/mole |
| pKa_Donor | Hydrogen donor ionization equilibria (acidic pKa) | pH |
| pKa_Accept | Hyrdogen acceptor ionization equilibria (basic pKa | pH |
| logMA | log10 Membrane Affinity | unitless |
| logP | log10 Octanol:Water Partition Coefficient (hydrophobicity) | unitless |
| logPwa | log10 Water:Air Partition Coefficient | unitless |
| logHenry | log10 Henry's Law Constant | atm-m3/mole |
| logWSol | log10 Water Solubility | moles/L: Water solubility at 25C |
| MP | Melting point | deg C |

176 get_rblood2plasma

Value

The parameters, either a single value, a named list for a single chemical, or a list of lists

get_physchem_param(param = c('logP', 'MW'), chem.cas = c('80-05-7', '81-81-2'))
# This function should be case-insensitive:
try(get_physchem_param(chem.cas="80-05-7","LogP"))
# Asking for a parameter we "don't" have produces an error:
try(get_physchem_param(chem.cas="80-05-7","MA"))
get_physchem_param(chem.cas="80-05-7","logMA")
# Ionization equilibria can be NA/none, a single value, or a series of values
# separated by commas:
get_physchem_param(chem.cas="80-05-7","pKa_Donor")
get_physchem_param(chem.cas="80-05-7","pKa_Accept")
get_physchem_param(chem.cas="71751-41-2", "pKa_Donor")
get_physchem_param(chem.cas="71751-41-2","pKa_Accept")
# If logMA (log10 membrane affinity) is NA, we use calc_ma() to predict it
# in the parameterization functions:
get_physchem_param(chem.cas="71751-41-2","logMA")
parameterize_steadystate(chem.cas="71751-41-2")
```

get_rblood2plasma

Get ratio of the blood concentration to the plasma concentration.

Description

This function attempts to retrieve a measured species- and chemical-specific blood:plasma concentration ratio.

Usage

```
get_rblood2plasma(
  chem.name = NULL,
  chem.cas = NULL,
  dtxsid = NULL,
```

get_weight_class 177

```
species = "Human",
default.to.human = FALSE
)
```

Arguments

chem. name Either the chemical name or the CAS number must be specified.

chem. cas Either the CAS number or the chemical name must be specified.

dtxsid EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chemical

must be identified by either CAS, name, or DTXSIDs

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

default.to.human

Substitutes missing animal values with human values if true.

Details

A value of NA is returned when the requested value is unavailable. Values are retrieved from chem.physical_and_invitro.data. details than the description above ~~

Value

A numeric value for the steady-state ratio of chemical concentration in blood to plasma

Author(s)

Robert Pearce

Examples

```
get_rblood2plasma(chem.name="Bisphenol A")
get_rblood2plasma(chem.name="Bisphenol A",species="Rat")
```

get_weight_class

Assign weight class (underweight, normal, overweight, obese)

Description

Given vectors of age, BMI, recumbent length, weight, and gender, categorizes weight classes using CDC and WHO categories.

Usage

```
get_weight_class(age_years, age_months, bmi, recumlen, weight, gender)
```

178 get_weight_class

Arguments

age_years A vector of ages in years.

age_months A vector of ages in months.

bmi A vector of BMIs.

recumlen A vector of heights or recumbent lengths in cm.

weight A vector of body weights in kg.

gender A vector of genders (as 'Male' or 'Female').

Details

According to the U.S. Centers for Disease Control and Prevention (CDC) (https://www.cdc.gov/disability-and-health/conditions/obesity.html), adult weight classes are defined using body mass index (BMI) as follows:

Underweight BMI less than 18.5

Normal BMI between 18.5 and 25

Overweight BMI between 25 and 30

Obese BMI greater than 30

For children ages 2 years and older, weight classes are defined using percentiles of sex-specific BMI for age, as follows (Barlow et al., 2007):

Underweight Below 5th percentile BMI for age

Normal 5th-85th percentile BMI for age

Overweight 85th-95th percentile BMI for age

Obese Above 95th percentile BMI for age

For children birth to age 2, weight classes are defined using percentiles of sex-specific weight-for-length (Grummer-Strawn et al., 2009). Weight above the 97.7th percentile, or below the 2.3rd percentile, of weight-for-length is considered potentially indicative of adverse health conditions. Here, weight below the 2.3rd percentile is categorized as "Underweight" and weight above the 97.7th percentile is categorized as "Obese."

Value

A character vector of weight classes. Each element will be one of 'Underweight', 'Normal', 'Overweight', or 'Obese'.

get_lit_cheminfo()
get_lit_cheminfo(info=c('CAS','MW'))
```

get_wetmore_css

Get literature Css (deprecated).

Description

This function is included for backward compatibility. It calls get_lit_css which retrieves a steady-state plasma concentration as a result of infusion dosing from the Wetmore et al. (2012) and (2013) publications and other literature.

Usage

```
get_wetmore_css(
  chem.cas = NULL,
  chem.name = NULL,
  daily.dose = 1,
  which.quantile = 0.95,
  species = "Human",
  clearance.assay.conc = NULL,
  output.units = "mg/L",
  suppress.messages = FALSE
)
```

get_wetmore_css 181

Arguments

chem. cas Either the cas number or the chemical name must be specified.

chem. name Either the chemical name or the CAS number must be specified.

daily.dose Total daily dose infused in units of mg/kg BW/day. Defaults to 1 mg/kg/day.

which quantile Which quantile from the SimCYP Monte Carlo simulation is requested. Can be a vector.

species Species desired (either "Rat" or default "Human").

clearance.assay.conc

Concentration of chemical used in measureing intrinsic clearance data, 1 or 10 uM.

output.units Returned units for function, defaults to mg/L but can also be uM (specify units

= "uM").

suppress.messages

Whether or not the output message is suppressed.

Value

A numeric vector with the literature steady-state plasma concentration (1 mg/kg/day) for the requested quantiles

Author(s)

John Wambaugh

Examples

```
get_lit_css(chem.cas="34256-82-1")
get_lit_css(chem.cas="34256-82-1", species="Rat", which.quantile=0.5)
get_lit_css(chem.cas="80-05-7", daily.dose = 1, which.quantile = 0.5, output.units = "uM")
```

```
get_wetmore_oral_equiv
```

Get Literature Oral Equivalent Dose (deprecated).

Description

This function is included for backward compatibility. It calls get_lit_oral_equiv which converts a chemical plasma concetration to an oral equivalent dose using the values from the Wetmore et al. (2012) and (2013) publications and other literature.

Usage

```
get_wetmore_oral_equiv(
  conc,
  chem.name = NULL,
  chem.cas = NULL,
  suppress.messages = FALSE,
  which.quantile = 0.95,
  species = "Human",
  input.units = "uM",
  output.units = "mg",
  clearance.assay.conc = NULL,
  ...
)
```

Arguments

conc Bioactive in vitro concentration in units of specified input.units, default of uM.

chem. name Either the chemical name or the CAS number must be specified.

chem. cas Either the CAS number or the chemical name must be specified.

suppress.messages

Suppress output messages.

which quantile Which quantile from the SimCYP Monte Carlo simulation is requested. Can be

a vector. Papers include 0.05, 0.5, and 0.95 for humans and 0.5 for rats.

species Species desired (either "Rat" or default "Human").

input.units Units of given concentration, default of uM but can also be mg/L.

output.units Units of dose, default of 'mg' for mg/kg BW/ day or 'mol' for mol/ kg BW/ day.

clearance.assay.conc

Concentration of chemical used in measureing intrinsic clearance data, 1 or 10

uM.

. . . Additional parameters passed to get_lit_css.

Value

Equivalent dose in specified units, default of mg/kg BW/day.

```

hct h

KDE bandwidths for residual variability in hematocrit

Description

Bandwidths used for a one-dimensional kernel density estimation of the distribution of residual errors around smoothing spline fits of hematocrit vs. age for NHANES respondents in each of ten combinations of sex and race/ethnicity categories.

Usage

hct_h

184 hematocrit_infants

Format

A named list with 10 elements, each a numeric value. Each list element corresponds to, and is named for, one combination of NHANES sex categories (Male and Female) and NHANES race/ethnicity categories (Mexican American, Other Hispanic, Non-Hispanic White, Non-Hispanic Black, and Other).

Details

Each matrix is the standard deviation for a normal distribution: this is the bandwidth to be used for a kernel density estimation (KDE) (using a normal kernel) of the distribution of residual errors around smoothing spline fits of hematocrit vs. age for NHANES respondents in the specified sex and race/ethnicity category. Optimal bandwidths were pre-calculated by doing the smoothing spline fits, getting the residuals, then calling kde on the residuals (which calls hpi to compute the plug-in bandwidth).

Used by HTTK-Pop only in "virtual individuals" mode (i.e. httkpop_generate with method = "v"), in estimate_hematocrit.

hematocrit_infants

Predict hematocrit in infants under 1 year old.

Description

For infants under 1 year, hematocrit was not measured in NHANES. Assume a log-normal distribution where plus/minus 1 standard deviation of the underlying normal distribution is given by the reference range. Draw hematocrit values from these distributions by age.

Usage

hematocrit_infants(age_months)

Arguments

age_months

Vector of ages in months; all must be <= 12.

Details

honda.ivive 185

| Age | Reference range |
|-------------|-----------------|
| <1 month | 31-49 |
| 1-6 months | 29-42 |
| 7-12 months | 33-38 |

Value

Vector of hematocrit percentages corresponding to the input vector of ages.

honda.ivive

Return the assumptions used in Honda et al. 2019

Description

This function returns four of the better performing sets of assumptions evaluated in Honda et al. 2019 (https://doi.org/10.1371/journal.pone.0217564). These include four different combinations of hepatic clearance assumption, in vivo bioactivity assumption, and relevant tissue assumption. Generally, this function is not called directly by the user, but instead called by setting the IVIVE option in calc_mc_oral_equiv, calc_mc_css, and calc_analytic functions. Currently, these IVIVE option is not implemented the solve_1comp etc. functions.

Usage

```
honda.ivive(method = "Honda1", tissue = "liver")
```

Arguments

method This is set to one of "Honda1", "Honda2", "Honda3", or "Honda4".

tissue This is only relevant to "Honda4" and indicates the relevant tissue compartment.

honda2023.data

Details

Only four sets of IVIVE assumptions that performed well in Honda et al. (2019) are currently included: "Honda1" through "Honda4". The use of max (peak) concentration can not be currently be calculated with calc_analytic_css. The httk default settings correspond to "Honda3":

| | In Vivo Conc. | Metabolic Clearance | Bioactive Chemical Conc. In Vivo | TK Statistic Used* |
|--------|------------------|---------------------|----------------------------------|--------------------|
| Honda1 | Veinous (Plasma) | Restrictive | Free | Mean Conc. In Vivo |
| Honda2 | Veinous | Restrictive | Free | Mean Conc. In Vivo |
| Honda3 | Veinous | Restrictive | Total | Mean Conc. In Vivo |
| Honda4 | Target Tissue | Non-restrictive | Total | Mean Conc. In Vivo |

Bioactive

"Honda1" uses plasma concentration, restrictive clearance, and treats the unbound invivo concentration as bioactive. For IVIVE, any input nominal concentration in vitro should be converted to cfree.invitro using armitage_eval, otherwise performance will be the same as "Honda2".

Value

A list of tissue, bioactive.free.invivo, and restrictive.clearance assumptions.

honda.ivive(method = "Honda1", tissue = NULL)
```

honda2023.data

Measured Caco-2 Apical-Basal Permeability Data

Description

In vitro Caco-2 membrane permeabilities characterize how readily absobed/transported a chemical is. These measurements are all for the apical-to-basal Caco-2 orientation. These data were either measured by EPA or collected by other others, as indicated by the column 'Data Origin'. Anywhere that the values is reported by three numbers separated by a comma (this also happens for plasma protein binding) the three values are: median, lower 95 percent confidence intervals, upper 95 percent confidence interval. Unless you are doing monte carlo work it makes sense to ignore the second and third values.

httkpop

httkpop: Virtual population generator for HTTK.

Description

The httkpop package generates virtual population physiologies for use in population TK.

Details

To simulate inter-individual variability in the TK model, a MC approach is used: the model parameters are sampled from known or assumed distributions, and the model is evaluated for each sampled set of parameters. To simulate variability across subpopulations, the MC approach needs to capture the parameter correlation structure. For example, kidney function changes with age (Levey et al., 2009), thus the distribution of GFR is likely different in 6-year-olds than in 65-yearolds. To directly measure the parameter correlation structure, all parameters need to be measured in each individual in a representative sample population. Such direct measurements are extremely limited. However, the correlation structure of the physiological parameters can be inferred from their known individual correlations with demographic and anthropometric quantities for which direct population measurements do exist. These quantities are sex, race/ethnicity, age, height, and weight (Howgate et al., 2006; Jamei et al., 2009a; Johnson et al., 2006; McNally et al., 2014; Price et al., 2003). Direct measurements of these quantities in a large, representative sample of the U.S. population are publicly available from NHANES. NHANES also includes laboratory measurements, including both serum creatinine, which can be used to estimate GFR (Levey et al., 2009), and hematocrit. For conciseness, sex, race/ethnicity, age, height, weight, serum creatinine, and hematocrit will be called the NHANES quantities.

HTTK-Pop's correlated MC approach begins by sampling from the joint distribution of the NHANES quantities to simulate a population. Then, for each individual in the simulated population, HTTKe-Pop predicts the physiological parameters from the NHANES quantities using regression equations from the literature (Barter et al., 2007; Baxter-Jones et al., 2011; Bosgra et al., 2012; Koo et al., 2000; Levey et al., 2009; Looker et al., 2013; McNally et al., 2014; Ogiu et al., 1997; Price et al., 2003; Schwartz and Work, 2009; Webber and Barr 2012). Correlations among the physiological

parameters are induced by their mutual dependence on the correlated NHANES quantities. Finally, residual variability is added to the predicted physiological parameters using estimates of residual marginal variance (i.e., variance not explained by the regressions on the NHANES quantities) (McNally et al., 2014).

Data were combined from the three most recent publicly-available NHANES cycles: 2007-2008, 2009-2010, and 2011-2012. For each cycle, some NHANES quantities - height, weight, serum creatinine, and hematocrit - were measured only in a subset of respondents. Only these subsets were included in HTTKePop. The pooled subsets from the three cycles contained 29,353 unique respondents. Some respondents were excluded from analysis: those with age recorded as 80 years (because all NHANES respondents 80 years and older were marked as "80"); those with missing height, weight or hematocrit data; and those aged 12 years or older with missing serum creatinine data. These criteria excluded 4807 respondents, leaving 24,546 unique respondents. Each NHANES respondent was assigned a cycle-specific sample weight, which can be interpreted as the number of individuals in the total U.S. population represented by each NHANES respondent in each cycle (Johnson et al., 2013). Because data from three cycles were combined, the sample weights were rescaled (divided by the number of cycles being combined, as recommended in NHANES data analysis documentation) (Johnson et al., 2013). To handle the complex NHANES sampling structure, the R survey package was used to analyze the NHANES data (Lumley, 2004).

To allow generation of virtual populations specified by weight class, we coded a categorical variable for each NHANES respondent. The categories Underweight, Normal, Overweight, or Obese were assigned based on weight, age, and height/length (Grummer-Strawn et al., 2010; Kuczmarski et al., 2002; Ogden et al., 2014; WHO, 2006, 2010). We implemented two population simulation methods within HTTK-Pop: the direct-resampling method and the virtual-individuals method. The direct-resampling method simulated a population by sampling NHANES respondents with replacement, with probabilities proportional to the sample weights. Each individual in the resulting simulated population was an NHANES respondent, identified by a unique NHANES sequence number. By contrast, the second method generates "virtual individuals" - sets of NHANES quantities that obey the approximate joint distribution of the NHANES quantities (calculated using weighted smoothing functions and kernel density estimators), but do not necessarily correspond to any particular NHANES respondent. The direct-resampling method removed the possibility of generating unrealistic combinations of the NHANES quantities; the virtual-individuals method allowed the use of interpolation to simulate subpopulations represented by only a small number of NHANES respondents.

For either method, HTTK-Pop takes optional specifications about the population to be simulated and then samples from the appropriate conditional joint distribution of the NHANES quantities.

Once HTTK-Pop has simulated a population characterized by the NHANES quantities, the physiological parameters of the TK model are predicted from the NHANES quantities using regression equations from the literature. Liver mass was predicted for individuals over age 18 using allometric scaling with height from Reference Man (Valentin, 2002), and for individuals under 18 using regression relationships with height and weight published by Ogiu et al. (1997). Residual marginal variability was added for each individual as in PopGen (McNally et al., 2014). Similarly, hepatic portal vein blood flows (in L/h) are predicted as fixed fractions of a cardiac output allometrically scaled with height from Reference Man (Valentin, 2002), and residual marginal variability is added for each individual (McNally et al., 2014). Glomerular filtration rate (GFR) (in L/h/1.73 m2 body surface area) is predicted from age, race, sex, and serum creatinine using the CKD-EPI equation, for individuals over age 18 (Levey et al., 2009). For individuals under age 18, GFR is estimated from body surface area (BSA) (Johnson et al., 2006); BSA is predicted using Mosteller's formula

(Verbraecken et al., 2006) for adults and Haycock's formula (Haycock et al., 1978) for children. Hepatocellularity (in millions of cells per gram of liver tissue) is predicted from age using an equation developed by Barter et al. (2007). Hematocrit is estimated from NHANES data for individuals 1 year and older. For individuals younger than 1 year, for whom NHANES did not measure hematocrit directly, hematocrit was predicted from age in months, using published reference ranges (Lubin, 1987).

In addition to the HTTK physiological parameters, the HTTK models include chemical-specific parameters representing the fraction of chemical unbound in plasma (Fup) and intrinsic clearance (CLint). Because these parameters represent interactions of the chemical with the body, their values will vary between individuals. To simulate this variability, Fub and CLint were included in MC simulations, by sampling from estimated or assumed distributions for the parameters defining them.

Variability in hematocrit was simulated either using NHANES data (for individuals ages 1 and older) or using age-based reference ranges (for individuals under age 1). Fup was treated as a random variable obeying a distribution censored below the average limit of quantification (LOQ) of the in vitro assay. Specifically, Fup was assumed to obey a normal distribution truncated below at 0 and above at 1, centered at the Fup value measured in vitro, with a 30 the average LOQ (0.01), Fup was instead drawn from a uniform distribution between 0 and 0.01. Fup was assumed to be independent of all other parameters. This censored normal distribution was chosen to match that used in Wambaugh et al. (2015).

Variability in hepatocellularity (106 cells/g liver) and Mliver (kg) were simulated. The remaining source of variability in CLint,h is variability in CLint, which was simulated using a Gaussian mixture distribution to represent the population proportions of poor metabolizers (PMs) and non-PMs of each substance. The true prevalence of PMs is isozyme-specific (Ma et al., 2002; Yasuda et al., 2008); however, isozyme-specific metabolism data were not available for the majority of chemicals considered. We therefore made a simplifying assumption that 5 slower than average. With 95 a normal distribution truncated below at zero, centered at the value measured in vitro, with a 30 CLint was drawn from a PM distribution: a truncated normal distribution centered on one-tenth of the in vitro value with 30 Both CLint itself and the probability of being a PM were assumed to be independent of all other parameters. The truncated normal nonePM distribution was chosen because it has been used (with 100 in previous work (Rotroff et al., 2010; Wambaugh et al., 2015; Wetmore et al., 2014; Wetmore et al., 2015; Wetmore et al., 2012); the PM distribution was chosen to comport with the nonePM distribution.

Main function to generate a population

If you just want to generate a table of (chemical-independent) population physiology parameters, use httkpop_generate.

Using HTTK-Pop with HTTK

To generate a population and then run an HTTK model for that population, the workflow is as follows:

- 1. Generate a population using httkpop_generate.
- 2. For a given HTTK chemical and general model, convert the population data to corresponding sets of HTTK model parameters using httkpop_mc.

httkpop_biotophys_default

Convert HTTK-Pop-generated parameters to HTTK physiological parameters

Description

Convert HTTK-Pop-generated parameters to HTTK physiological parameters

Usage

httkpop_biotophys_default(indiv_dt)

Arguments

indiv_dt

The data.table object returned by httkpop_generate()

Value

A data.table with the physiological parameters expected by any HTTK model, including body weight (BW), hematocrit, tissue volumes per kg body weight, tissue flows as fraction of CO, CO per (kg BW)^3/4, GFR per (kg BW)^3/4, portal vein flow per (kg BW)^3/4, and liver density.

Author(s)

Caroline Ring

References

```
httkpop_direct_resample
```

Generate a virtual population by directly resampling the NHANES data.

Description

Generate a virtual population by directly resampling the NHANES data.

Usage

```
httkpop_direct_resample(
  nsamp = NULL,
  gendernum = NULL,
  agelim_years = NULL,
  agelim_months = NULL,
 weight_category = c("Underweight", "Normal", "Overweight", "Obese"),
 gfr_category = c("Normal", "Kidney Disease", "Kidney Failure"),
  reths = c("Mexican American", "Other Hispanic", "Non-Hispanic White",
    "Non-Hispanic Black", "Other"),
  gfr_resid_var = TRUE,
  ckd_epi_race_coeff = FALSE,
  nhanes_mec_svy
)
```

Arguments

nsamp

The desired number of individuals in the virtual population. nsamp need not be

provided if gendernum is provided.

gendernum

Optional: A named list giving the numbers of male and female individuals to include in the population, e.g. list(Male=100, Female=100). Default is NULL, meaning both males and females are included, in their proportions in the NHANES data. If both nsamp and gendernum are provided, they must agree (i.e., nsamp must be the sum of gendernum).

agelim_years

Optional: A two-element numeric vector giving the minimum and maximum ages (in years) to include in the population. Default is c(0.79). If agelim_years is provided and agelim_months is not, agelim_years will override the default value of agelim_months.

agelim_months

Optional: A two-element numeric vector giving the minimum and maximum ages (in months) to include in the population. Default is c(0, 959), equivalent to the default agelim_years. If agelim_months is provided and agelim_years is not, agelim_months will override the default values of agelim_years.

weight_category

Optional: The weight categories to include in the population. Default is c('Underweight', 'Normal', 'Overweight', 'Obese'). User-supplied vector must contain one or more of these strings.

gfr_category The kidney function categories to include in the population. Default is c('Normal', 'Kidney Disease', 'Kidney Failure') to include all kidney function levels.

reths Optional: a character vector giving the races/ethnicities to include in the popula-

tion. Default is c('Mexican American', 'Other Hispanic', 'Non-Hispanic White', 'Non-Hispanic Black', 'Other'), to include all races and ethnicities in their proportions in the NHANES data. User-supplied vector must contain

one or more of these strings.

gfr_resid_var Logical value indicating whether or not to include residual variability when gen-

erating GFR values. (Default is TRUE.)

ckd_epi_race_coeff

Logical value indicating whether or not to use the "race coefficient" from the

CKD-EPI equation when estimating GFR values. (Default is FALSE.)

nhanes_mec_svy surveydesign object created from mecdt using svydesign (this is done in

httkpop_generate)

Value

A data.table where each row represents an individual, and each column represents a demographic, anthropometric, or physiological parameter.

Author(s)

Caroline Ring

References

```
httkpop_direct_resample_inner
```

Inner loop function called by httkpop_direct_resample.

Description

Inner loop function called by httkpop_direct_resample.

Usage

```
httkpop_direct_resample_inner(
  nsamp,
  gendernum,
  agelim_months,
  agelim_years,
  reths,
```

```
weight_category,
  gfr_resid_var,
  ckd_epi_race_coeff,
  nhanes_mec_svy
)
```

Arguments

nsamp

The desired number of individuals in the virtual population. nsamp need not be provided if gendernum is provided.

gendernum

Optional: A named list giving the numbers of male and female individuals to include in the population, e.g. list(Male=100, Female=100). Default is NULL, meaning both males and females are included, in their proportions in the NHANES data. If both nsamp and gendernum are provided, they must agree (i.e., nsamp must be the sum of gendernum).

agelim_months

Optional: A two-element numeric vector giving the minimum and maximum ages (in months) to include in the population. Default is c(0, 959), equivalent to the default agelim_years. If agelim_months is provided and agelim_years is not, agelim_months will override the default values of agelim_years.

agelim_years

Optional: A two-element numeric vector giving the minimum and maximum ages (in years) to include in the population. Default is c(0,79). If agelim_years is provided and agelim_months is not, agelim_years will override the default value of agelim_months.

reths

Optional: a character vector giving the races/ethnicities to include in the population. Default is c('Mexican American', 'Other Hispanic', 'Non-Hispanic White', 'Non-Hispanic Black', 'Other'), to include all races and ethnicities in their proportions in the NHANES data. User-supplied vector must contain one or more of these strings.

weight_category

Optional: The weight categories to include in the population. Default is c ('Underweight', 'Normal', 'Overweight', 'Obese'). User-supplied vector must contain one or more of these strings.

gfr_resid_var

Logical value indicating whether or not to include residual variability when generating GFR values. (Default is TRUE, passed from 'httkpop_direct_resample'.)

ckd_epi_race_coeff

Logical value indicating whether or not to use the "race coefficient" from the CKD-EPI equation when estimating GFR values. (Default is FALSE, passed from 'httkpop direct resample'.)

nhanes_mec_svy surveydesign object created from mecdt using svydesign (this is done in httkpop_generate)

Value

A data table where each row represents an individual, and each column represents a demographic, anthropometric, or physiological parameter.

Author(s)

Caroline Ring

References

Ring CL, Pearce RG, Setzer RW, Wetmore BA, Wambaugh JF (2017). "Identifying populations sensitive to environmental chemicals by simulating toxicokinetic variability." *Environment International*, **106**, 105–118. doi:10.1016/j.envint.2017.06.004.

httkpop_generate

Generate a virtual population for PBTK

Description

Generate a virtual population characterized by demographic, anthropometric, and physiological parameters relevant to PBTK.

Usage

```
httkpop_generate(
  method,
  nsamp = NULL,
  gendernum = NULL,
  agelim_years = NULL,
  agelim_months = NULL,
  weight_category = c("Underweight", "Normal", "Overweight", "Obese"),
  gfr_category = c("Normal", "Kidney Disease", "Kidney Failure"),
  reths = c("Mexican American", "Other Hispanic", "Non-Hispanic White",
        "Non-Hispanic Black", "Other"),
  gfr_resid_var = TRUE,
  ckd_epi_race_coeff = FALSE
)
```

Arguments

method The population-generation method to use. Either "virtual individuals" or "direct

resampling." Short names may be used: "d" or "dr" for "direct resampling", and

"v" or "vi" for "virtual individuals".

nsamp The desired number of individuals in the virtual population. nsamp need not be

provided if gendernum is provided.

gendernum Optional: A named list giving the numbers of male and female individuals to include in the population, e.g. list(Male=100, Female=100). Default is

NULL, meaning both males and females are included, in their proportions in the NHANES data. If both nsamp and gendernum are provided, they must agree

(i.e., nsamp must be the sum of gendernum).

agelim_years

Optional: A two-element numeric vector giving the minimum and maximum ages (in years) to include in the population. Default is c(0,79). If only a single value is provided, both minimum and maximum ages will be set to that value; e.g. agelim_years=3 is equivalent to agelim_years=c(3,3). If agelim_years is provided and agelim_months is not, agelim_years will override the default value of agelim_months.

agelim_months

Optional: A two-element numeric vector giving the minimum and maximum ages (in months) to include in the population. Default is c(0, 959), equivalent to the default agelim_years. If only a single value is provided, both minimum and maximum ages will be set to that value; e.g. agelim_months=36 is equivalent to agelim_months=c(36,36). If agelim_months is provided and agelim_years is not, agelim_months will override the default values of agelim_years.

weight_category

Optional: The weight categories to include in the population. Default is c('Underweight', 'Normal', 'Overweight', 'Obese'). User-supplied vector must contain one or more of these strings.

gfr_category

The kidney function categories to include in the population. Default is c('Normal', 'Kidney Disease', 'Kidney Failure') to include all kidney function levels.

reths

Optional: a character vector giving the races/ethnicities to include in the population. Default is c('Mexican American','Other Hispanic','Non-Hispanic White','Non-Hispanic Black','Other'), to include all races and ethnicities in their proportions in the NHANES data. User-supplied vector must contain one or more of these strings.

gfr_resid_var

TRUE to add residual variability to GFR predicted from serum creatinine; FALSE to not add residual variability

ckd_epi_race_coeff

TRUE to use the CKD-EPI equation as originally published (with a coefficient changing predicted GFR for individuals identified as "Non-Hispanic Black"); FALSE to set this coefficient to 1.

Details

Demographic and anthropometric (body measures) variables, along with serum creatinine and hematocrit, are generated from survey data from the Centers for Disease Control's National Health and Nutrition Examination Survey (NHANES). Those data are stored in the object nhanes_mec_svy (a survey.design object, see package survey). With method = "d", these variables will be sampled with replacement directly from NHANES data. Each NHANES respondent's likelihood of being sampled is given by their sample weight. With method = "v", these variables will be sampled from distributions fitted to NHANES data. Tissue masses and flows are generated based on demographic, body measures, and serum creatinine values, using regression equations from the literature and/or allometric scaling based on height. Extensive details about how each of these parameters are generated are available in the supplemental material of Ring et al. (2017) (see References for full citation).

Value

A data.table where each row represents an individual, and each column represents a demographic, anthropometric, or physiological parameter. Details of the parameters returned and their units are

in the following tables.

Demographic variables

| Name | Defini |
|------------|--|
| seqn | NHANES unique identifier (only included if method = "direct resampli |
| gender | Sex: "Male" or "Fem |
| reth | Race/ethnicity: "Non-Hispanic Black", "Non-Hispanic white", "Mexican American", "Other Hispanic", or "Ot |
| age_years | Age (0-79 ye |
| age_months | Age (0-959 mor |

Body measures and laboratory measurements

Name

Examples

```
#Simply generate a virtual population of 100 individuals,
#using the direct-resampling method
 set.seed(42)
httkpop_generate(method='direct resampling', nsamp=100)
#Generate a population using the virtual-individuals method,
#including 80 females and 20 males,
#including only ages 20-65,
#including only Mexican American and
#Non-Hispanic Black individuals,
#including only non-obese individuals
set.seed(42)
mypop <- httkpop_generate(method = 'virtual individuals',</pre>
                           gendernum=list(Female=80,
                           Male=20),
                           agelim_years=c(20,65),
                           reths=c('Mexican American',
                           'Non-Hispanic Black'),
                           weight_category=c('Underweight',
                           'Normal',
                           'Overweight'))
# Including a httkpop.dt argument will overwrite the number of sample and
# the httkpop on/off logical switch:
samps1 <- create_mc_samples(chem.name="bisphenola",</pre>
                            httkpop=FALSE,
                            httkpop.dt=mypop)
samps2 <- create_mc_samples(chem.name="bisphenola",</pre>
                           httkpop.dt=mypop)
samps3 <- create_mc_samples(chem.name="bisphenola",</pre>
                           httkpop=FALSE)
# Now run calc_mc_oral equiv on the same pop for two different chemcials:
calc_mc_oral_equiv(conc=10,
                   chem.name="bisphenola",
                   httkpop.dt=mypop,
                   return.samples=TRUE)
calc_mc_oral_equiv(conc=2,
                   chem.name="triclosan",
                   httkpop.dt=mypop,
                   return.samples=TRUE)
```

204 httkpop_mc

Description

This is the core function for httk-pop correlated human physiological variability simulation as described by Ring et al. (2017) (doi:10.1016/j.envint.2017.06.004). This functions takes the data table of population biometrics (one individual per row) generated by httkpop_generate, and converts it to the corresponding table of HTTK model parameters for a specified HTTK model.

Usage

```
httkpop_mc(model, samples = 1000, httkpop.dt = NULL, ...)
```

Arguments

| model | One of the HTTK models: "1compartment", "3compartmentss", "3compartment", or "pbtk". |
|------------|---|
| samples | The number of Monte Carlo samples to use (can often think of these as separate individuals) |
| httkpop.dt | A data table generated by httkpop_generate. This defaults to NULL, in which case httkpop_generate is called to generate this table. |
| | Additional arugments passed on to httkpop_generate. |

Details

The Monte Carlo methods used here were recently updated and described by Breen et al. (submitted).

Value

A data.table with a row for each individual in the sample and a column for each parater in the model.

httkpop_virtual_indiv 205

Examples

httkpop_virtual_indiv Generate a virtual population by the virtual individuals method.

Description

Generate a virtual population by the virtual individuals method.

Usage

```
httkpop_virtual_indiv(
   nsamp = NULL,
   gendernum = NULL,
   agelim_years = NULL,
   agelim_months = NULL,
   weight_category = c("Underweight", "Normal", "Overweight", "Obese"),
   gfr_category = c("Normal", "Kidney Disease", "Kidney Failure"),
   reths = c("Mexican American", "Other Hispanic", "Non-Hispanic White",
        "Non-Hispanic Black", "Other"),
   gfr_resid_var = TRUE,
   ckd_epi_race_coeff = FALSE,
   nhanes_mec_svy
)
```

Arguments

nsamp

The desired number of individuals in the virtual population. nsamp need not be provided if gendernum is provided.

gendernum

Optional: A named list giving the numbers of male and female individuals to include in the population, e.g. list(Male=100,Female=100). Default is NULL, meaning both males and females are included, in their proportions in the NHANES data. If both nsamp and gendernum are provided, they must agree (i.e., nsamp must be the sum of gendernum).

agelim_years

Optional: A two-element numeric vector giving the minimum and maximum ages (in years) to include in the population. Default is c(0,79). If agelim_years is provided and agelim_months is not, agelim_years will override the default value of agelim_months.

206 httk_chem_subset

agelim_months Optional: A two-element numeric vector giving the minimum and maximum

ages (in months) to include in the population. Default is c(0, 959), equivalent to the default agelim_years. If agelim_months is provided and agelim_years is not, agelim_months will override the default values of agelim_years.

weight_category

Optional: The weight categories to include in the population. Default is c('Underweight',

'Normal', 'Overweight', 'Obese'). User-supplied vector must contain one

or more of these strings.

gfr_category The kidney function categories to include in the population. Default is c('Normal', 'Kidney

Disease', 'Kidney Failure') to include all kidney function levels.

reths Optional: a character vector giving the races/ethnicities to include in the popula-

tion. Default is c('Mexican American', 'Other Hispanic', 'Non-Hispanic White', 'Non-Hispanic Black', 'Other'), to include all races and ethnicities in their proportions in the NHANES data. User-supplied vector must contain

one or more of these strings.

gfr_resid_var Logical value indicating whether or not to include residual variability when gen-

erating GFR values. (Default is TRUE.)

ckd_epi_race_coeff

Logical value indicating whether or not to use the "race coefficient" from the

CKD-EPI equation when estimating GFR values. (Default is FALSE.)

nhanes_mec_svy surveydesign object created from mecdt using svydesign (this is done in

httkpop_generate, which calls this function)

Value

A data.table where each row represents an individual, and each column represents a demographic, anthropometric, or physiological parameter.

httk_chem_subset

HTTK data chemical subsetting function

Description

This function is meant to take any 'httk' data and subset it based on a list of chemicals provided. Main functionality is for speeding up the 'load_sipes2017', 'load_pradeep2020', 'load_dawson2021', 'load_honda2023', and similar phys-chem data files. However, it should be generalizable to any dataset with CAS/CASRN or DTXSID chemical identifiers.

hw_H

Usage

httk_chem_subset(data, chem_include)

Arguments

data Data frame, with chemical data, to be subset.

chem_include (character vector) A character vector containing CAS/CASRN or DTXSID chem-

ical identifiers to include in the data subset.

Value

A subset data set containing only the data rows for chemicals identified as those that should be included.

hw_H

KDE bandwidth for residual variability in height/weight

Description

Bandwidths used for a two-dimensional kernel density estimation of the joint distribution of residual errors around smoothing spline fits of height vs. age and weight vs. age for NHANES respondents in each of ten combinations of sex and race/ethnicity categories.

Usage

hw_H

Format

A named list with 10 elements, each a matrix with 2 rows and 2 columns. Each list element corresponds to, and is named for, one combination of NHANES sex categories (Male and Female) and NHANES race/ethnicity categories (Mexican American, Other Hispanic, Non-Hispanic White, Non-Hispanic Black, and Other).

Details

Each matrix is a variance-covariance matrix for a two-dimensional normal distribution: this is the bandwidth to be used for a two-dimensional kernel density estimation (KDE) (using a two-dimensional normal kernel) of the joint distribution of residual errors around smoothing spline fits of height vs. age and weight vs. age for NHANES respondents in the specified sex and race/ethnicity category. Optimal bandwidths were pre-calculated by doing the smoothing spline fits, getting the residuals, then calling kde on the residuals (which calls Hpi to compute the plug-in bandwidth).

Used by HTTK-Pop only in "virtual individuals" mode (i.e. httkpop_generate with method = "v"), in gen_height_weight.

Author(s)

Caroline Ring

References

Ring CL, Pearce RG, Setzer RW, Wetmore BA, Wambaugh JF (2017). "Identifying populations sensitive to environmental chemicals by simulating toxicokinetic variability." *Environment International*, **106**, 105–118. doi:10.1016/j.envint.2017.06.004.

in.list

Convenience Boolean (yes/no) functions to identify chemical membership in several key lists.

Description

These functions allow easy identification of whether or not a chemical CAS is included in various research projects. While it is our intent to keep these lists up-to-date, the information here is only for convenience and should not be considered to be definitive.

Usage

```
in.list(chem.cas = NULL, which.list = "ToxCast")
```

Arguments

chem. cas The Chemical Abstracts Service Resgistry Number (CAS-RN) corresponding to

the chemical of interest.

which.list A character string that can take the following values: "ToxCast", "Tox21", "Ex-

poCast", "NHANES", ""NHANES.serum.parent", "NHANES.serum.analyte", "NHANES.blood.parent", "

"NHANES.urine.parent","NHANES.urine.analyte"

Details

Tox21: Toxicology in the 21st Century (Tox21) is a U.S. federal High Throughput Screening (HTS) collaboration among EPA, NIH, including National Center for Advancing Translational Sciences and the National Toxicology Program at the National Institute of Environmental Health Sciences, and the Food and Drug Administration. (Bucher et al., 2008)

ToxCast: The Toxicity Forecaster (ToxCast) is a HTS screening project led by the U.S. EPA to perform additional testing of a subset of Tox21 chemicals. (Judson et al. 2010)

ExpoCast: ExpoCast (Exposure Forecaster) is an U.S. EPA research project to generate tenetative exposure estimates (e.g., mg/kg BW/day) for thousands of chemicals that have little other information using models and informatics. (Wambaugh et al. 2014)

NHANES: The U.S. Centers for Disease Control (CDC) National Health and Nutrition Examination Survery (NHANES) is an on-going survey to characterize the health and biometrics (e.g., weight, height) of the U.S. population. One set of measurments includes the quantification of xenobiotic chemicals in various samples (blood, serum, urine) of the thousands of surveyed individuals. (CDC, 2014)

in.list 209

Value

logical

A Boolean (1/0) value that is TRUE if the chemical is in the list.

210 invitro_mc

Description

ToxCast In Vitro Assay Descriptors

Usage

```
invitro.assay.params
```

Format

data.table and data.frame

Author(s)

Madison Feshuk

invitro_mc

Monte Carlo for in vitro toxicokinetic parameters including uncertainty and variability.

Description

Given a CAS in the HTTK data set, a virtual population from HTTK-Pop, some user specifications on the assumed distributions of Funbound.plasma and Clint, draw "individual" values of Funbound.plasma and Clint from those distributions. The methodology for this function was developed and described by Wambaugh et al. (2019) (doi:10.1093/toxsci/kfz205).

Usage

```
invitro_mc(
  parameters.dt = NULL,
  samples,
  fup.meas.mc = TRUE,
  fup.pop.mc = TRUE,
  clint.meas.mc = TRUE,
  clint.pop.mc = TRUE,
  fup.meas.cv = 0.4,
  clint.meas.cv = 0.3,
  fup.pop.cv = 0.3,
  clint.pop.cv = 0.3,
  caco2.meas.sd = 0.3,
  caco2.Fgut = TRUE,
```

invitro_mc 211

```
Caco2.Fabs = TRUE,
keepit100 = FALSE,
poormetab = TRUE,
fup.lod = 0.01,
fup.censored.dist = FALSE,
adjusted.Funbound.plasma = TRUE,
adjusted.Clint = TRUE,
clint.pvalue.threshold = 0.05,
minimum.Funbound.plasma = 1e-04
```

Arguments

| parameters.dt | A data table of physiological and chemical-specific parameters | |
|---------------------|---|--|
| samples | The number of samples to draw. | |
| fup.meas.mc | Logical – should we perform measurment (uncertainty) Monte Carlo for Funbound.plasma values (Default TRUE). If FALSE, the user may choose to provide columns for "unadjusted.Funbound.plasma" or "fup.mean" from their own methods. | |
| fup.pop.mc | $Logical-should\ we\ perform\ population\ (variability)\ Monte\ Carlo\ for\ Funbound\ .\ plasmavalues\ (Default\ TRUE)$ | |
| clint.meas.mc | Logical – should we perform measurment (uncertainty) Monte Carlo for Clint values (Default TRUE) | |
| clint.pop.mc | Logical – should we perform population (variability) Monte Carlo for Clint values (Default TRUE) | |
| fup.meas.cv | Coefficient of variation of distribution of measured Funbound.plasma values. | |
| clint.meas.cv | Coefficient of variation of distribution of measured Clint values. | |
| fup.pop.cv | Coefficient of variation of distribution of population Funbound.plasma values. | |
| clint.pop.cv | Coefficient of variation of distribution of population Clint values. | |
| caco2.meas.sd | Standard deviation of the measured oral absorption - numeric value (Default 0.3). | |
| caco2.pop.sd | Standard deviation of the population level oral absorption - numeric value (Default 0.3). | |
| Caco2.Fgut | = TRUE uses Caco2.Pab to calculate fgut.oral, otherwise fgut.oral = Fgut. | |
| Caco2.Fabs | = TRUE uses Caco2.Pab to calculate fabs.oral, otherwise fabs.oral = Fabs. | |
| keepit100 | = TRUE overwrites Fabs and Fgut with 1 (i.e. 100 percent) regardless of other settings. | |
| poormetab | Logical. Whether to include poor metabolizers in the Clint distribution or not. | |
| fup.lod | The average limit of detection for Funbound.plasma, below which distribution will be censored if fup.censored.dist is TRUE. Default 0.01. | |
| fup, censored, dist | | |

fup.censored.dist

 $\label{logical.} Logical. \ Whether to \ draw \ {\tt Funbound.plasma} \ from \ a \ censored \ distribution \ or \\ not.$

212 invitro_mc

adjusted.Funbound.plasma

Uses the Pearce et al. (2017) lipid binding adjustment for Funbound.plasma when set to TRUE (Default).

adjusted.Clint Uses Kilford et al. (2008) hepatocyte incubation binding adjustment for Clint when set to TRUE (Default).

clint.pvalue.threshold

Hepatic clearance for chemicals where the in vitro clearance assay result has a p-values greater than the threshold are set to zero.

minimum.Funbound.plasma

Monte Carlo draws less than this value are set equal to this value (default is 0.0001 – half the lowest measured Fup in our dataset).

parameters A list of chemical-specific model parameters containing at least Funbound.plasma, Clint, and Fhep.assay.correction.

Details

The Monte Carlo methods used here were recently updated and described by Breen et al. (2022).

Value

A data.table with three columns: Funbound.plasma and Clint, containing the sampled values, and Fhep.assay.correction, containing the value for fraction unbound in hepatocyte assay.

Examples

#Simply generate a virtual population of 100 individuals, #using the direct-resampling method

is.httk 213

```
# Pull mean chemical=specific values:
chem.props <- parameterize_pbtk(chem.name="bisphenolb")

# Convert to data.table with one row per sample:
parameters.dt <- monte_carlo(chem.props,samples=100)

# Use httk-pop to generate a population:
pop <- httkpop_generate(method='direct resampling', nsamp=100)

# Overwrite parameters specified by httk-pop:
parameters.dt[,names(pop):=pop]

# Vary in vitro parameters:
parameters.dt <- invitro_mc(parameters.dt,samples=100)</pre>
```

is.httk

Convenience Boolean (yes/no) function to identify chemical membership and treatment within the httk project.

Description

Allows easy identification of whether or not a chemical CAS is included in various aspects of the httk research project (by model type and species of interest). While it is our intent to keep these lists up-to-date, the information here is only for convenience and should not be considered definitive.

Usage

```
is.httk(chem.cas, species = "Human", model = "3compartmentss")
```

Arguments

chem. cas The Chemical Abstracts Service Resgistry Number (CAS-RN) corresponding to

the chemical of interest.

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

model Model used in calculation, 'pbtk' for the multiple compartment model, '1com-

partment' for the one compartment model, '3compartment' for three compartment model, '3compartmentss' for the three compartment model without partition coefficients, or 'schmitt' for chemicals with logP and fraction unbound

(used in predict_partitioning_schmitt).

}
```

is_in_inclusive

Checks whether a value, or all values in a vector, is within inclusive limits

Description

Checks whether a value, or all values in a vector, is within inclusive limits

Usage

```
is_in_inclusive(x, lims)
```

Arguments

Χ

A numeric value, or vector of values.

lims

A two-element vector of (min, max) values for the inclusive limits. If x is a vector, lims may also be a two-column matrix with nrow=length(x) where the first column is lower limits and the second column is upper limits. If x is a vector and lims is a two-element vector, then each element of x will be checked against the same limits. If x is a vector and lims is a matrix, then each element of x will be checked against the limits given by the corresponding row of lims.

Value

A logical vector the same length as x, indicating whether each element of x is within the inclusive limits given by lims.

kramer_eval

Evaluate the Kramer In Vitro Distribution model

Description

Evaluate the Kramer model for chemical distribution *in vitro*. Takes input as data table or vectors of values. Outputs a data table.

Usage

```
kramer_eval(
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  casrn.vector = NA_character_,
  nomconc.vector = 1,
  this.well_number = 384,
  tcdata = NA,
  user_assay_parameters = NA,
  this.serum = NA_real_,
  this.csalt = 0.15,
  this.BSA = 44,
  this.v_total = NA_real_,
  this.v_working = NA_real_,
  this.cell_yield = NA_real_,
  this.L_per_mil_cells = 2.772e-06,
  this.sarea = NA_real_,
  this. Tsys = 37,
  this. Tref = 298.15,
  this.temp_k = 298.15,
  this.prot_conc = 0.21,
  this.option.bottom = TRUE,
  restrict.ion.partitioning = FALSE,
  surface.area.switch = TRUE
)
```

kramer_eval 219

Arguments

chem.cas A single or vector of Chemical Abstracts Service Registry Number(s) (CAS-

RN) of desired chemical(s).

chem.name A single or vector of name(s)) of desired chemical(s).

dtxsid A single or vector of EPA's DSSTox Structure ID(s) (https://comptox.epa.

gov/dashboard)

casrn.vector A deprecated argument specifying a single or vector of Chemical Abstracts Ser-

vice Registry Number(s) (CAS-RN) of desired chemical(s).

nomconc.vector For vector or single value, micromolar (uM = mol/L) nominal concentration

(e.g. AC50 value)

this.well_number

For single value, plate format default is 384, used if is.na(tcdata)==TRUE. This value chooses default surface area settings for armitage_estimate_sarea based

on the number of wells per plate.

tcdata A data.table with casrn, nomconc, v_total, v_working. Otherwise supply single

values to this params (e.g., this sarea, this v_total, etc.). Chemical parameters

are taken from chem.physical_and_invitro.data.

user_assay_parameters

option to fill in your own assay parameters (data table)

this.serum Concentration of serum in media (percent volume/volume)

this.csalt Ionic strength of buffer, mol/L

this.BSA Bovine serum albumin concentration in serum (g/L)

this.v_total Total volume of well (uL)

this.v_working Volume of medium per well (uL)

this.cell_yield

Number of cells/well seeded (unitless)

this.L_per_mil_cells

Liters per 1 million cells

this.sarea Surface area of plastic exposed to medium (m^2)

this.Tsys System temperature (Celcius)
this.Tref Reference temperature (Kelvin)

this.temp_k Temperature (Kelvin)

this.prot_conc Cell protein concentration (mg protein/million cells)

this.option.bottom

Include the bottom of the well in surface area calculation

restrict.ion.partitioning

only allow neutral fraction to partition

surface.area.switch

TRUE, automatically calculates surface area, switch to FALSE if user provided

casrn description well_number description

nomconc Nominal test concentration (uM)

220 list_models

Value

| Input Parameter | Description | Units |
|-----------------------|----------------------------|----------|
| concentration_cells | Concentration in cells | uM |
| concentration_medium | Concentration in medium | uM |
| concentration_plastic | Concentration in plastic | umol/m^2 |
| concentration_air | Concentration in headspace | uM |

list_models

List all available HTTK models

Description

List all available HTTK models

Usage

list_models()

Value

Prints a list of available HTTK models to the screen.

Author(s)

John Wambaugh

liver_mass_children 221

Description

For individuals under 18, predict the liver mass from height, weight, and gender, using equations from Ogiu et al. 1997

Usage

liver_mass_children(height, weight, gender)

Arguments

height Vector of heights in cm.
weight Vector of weights in kg.

gender Vector of genders (either 'Male' or 'Female').

Value

A vector of liver masses in kg.

Author(s)

Caroline Ring

References

Ogiu, Nobuko, et al. "A statistical analysis of the internal organ weights of normal Japanese people." Health physics 72.3 (1997): 368-383.

load_dawson2021 Load CLint and Fup QSPR predictions from Dawson et al. 2021.

Description

This function returns an updated version of chem.physical_and_invitro.data that includes Clint and Fup predictions from the Random Forest quantitative structure-property relationship (QSPR) models developed and presented in Dawson et al. 2021, included in table dawson2021.

222 load_dawson2021

Usage

```
load_dawson2021(
  overwrite = FALSE,
  exclude_oad = TRUE,
  chem_include = NULL,
  target.env = .GlobalEnv
)
```

Arguments

overwrite Only matters if load.image=FALSE. If overwrite=TRUE then existing data in

chem.physical_and_invitro.data will be replaced by any predictions in Dawson et al. (2021) that is for the same chemical and property. If overwrite=FALSE (DEFAULT) then new data for the same chemical and property are ignored. Funbound.plasma values of 0 (below limit of detection) are overwritten either

way.

exclude_oad Include the chemicals only within the applicability domain. If exclude oad=TRUE

(DEFAULT) chemicals outside the applicability domain do not have their pre-

dicted values loaded.

chem_include A vector of CAS numbers indicating only the chemicals to be included in the

loading process. If set to 'NULL' all applicable chemicals are loaded. (Default

is 'NULL'.)

target.env The environment where the new chem.physical_and_invitro.data is loaded.

Defaults to global environment.

Details

Because Clint and Fup are the only measurements required for many HTTK models, changing the number of chemicals for which a value is available will change the number of chemicals which are listed with the get_cheminfo command. Use the command reset_httk to return to the initial (measured only) chem.physical_and_invitro.data (for all parameters).

Value

data.frame An updated version of chem.physical_and_invitro.data.

load_honda2023

Load Caco2 QSPR predictions from Honda et al. 2023

Description

This function returns an updated version of chem.physical_and_invitro.data that includes Caco2 Pab predictions from the Random Forest quantitative structure-property relationship (QSPR) models developed and presented in Honda et al. 2023, included in table honda2023.qspr.

Usage

```
load_honda2023(
  overwrite = FALSE,
  exclude_oad = TRUE,
  chem_include = NULL,
  target.env = .GlobalEnv
)
```

load_honda2023 225

Arguments

Only matters if load.image=FALSE. If overwrite=TRUE then existing data in chem.physical_and_invitro.data will be replaced by any prediction in Honda et al. (2023) that is for the same chemical and property. If overwrite=FALSE (DEFAULT) then new data for the same chemical and property are ignored.

exclude_oad

Include the chemicals only within the applicability domain. If exclude_oad=TRUE (DEFAULT) chemicals outside the applicability domain do not have their predicted values loaded.

chem_include

A vector of CAS numbers indicating only the chemicals to be included in the loading process. If set to 'NULL' all applicable chemicals are loaded. (Default is 'NULL'.)

target.env

The environment where the new chem.physical_and_invitro.data is loaded.

Details

Note that because Pab is not required for most HTTK models, changing the number of chemicals for which a value is available will not change the number of chemicals which are listed with the get_cheminfo command. Use the command reset_httk to return to the initial (measured only) chem.physical_and_invitro.data (for all parameters).

Value

data.frame An updated version of chem.physical_and_invitro.data.

Defaults to global environment.

load_sipes2017

Load CLint and Fup QSPR predictions from Sipes et al 2017.

Description

This function returns an updated version of chem.physical_and_invitro.data that includes quantitative structure-property relationship (QSPR) predictions from Simulations Plus' ADMET predictor as used in Sipes et al. 2017, included in sipes2017.

load_sipes2017 229

Usage

```
load_sipes2017(overwrite = FALSE, chem_include = NULL, target.env = .GlobalEnv)
```

Arguments

overwrite Only matters if load.image=FALSE. If overwrite=TRUE then existing data in

chem.physical_and_invitro.data will be replaced by any predictions in Sipes et al. (2017) that is for the same chemical and property. If overwrite=FALSE (DEFAULT) then new data for the same chemical and property are ignored. Funbound.plasma values of 0 (below limit of detection) are overwritten either

way.

chem_include A vector of CAS numbers indicating only the chemicals to be included in the

loading process. If set to 'NULL' all applicable chemicals are loaded. (Default

is 'NULL'.)

target.env The environment where the new chem.physical_and_invitro.data is loaded.

Defaults to global environment.

Details

Because Clint and Fup are the only measurements required for many HTTK models, changing the number of chemicals for which a value is available will change the number of chemicals which are listed with the get_cheminfo command. Use the command reset_httk to return to the initial (measured only) chem.physical_and_invitro.data (for all parameters).

Value

data.frame An updated version of chem.physical_and_invitro.data.

lump_tissues

Lump tissue parameters into model compartments

Description

This function takes the tissue:plasma partition coefficients from predict_partitioning_schmitt along with the tissue-specific volumes and flows and aggregates (or "lumps") them according to the needed scheme of toxicokinetic model tissue comparents.

predict_partitioning_schmitt makes tissue-specific predictions drawing from those tissues described in tissue.data. Since different physiologically-based toxicokinetic (PBTK) models use diffeent schemes for rganizing the tissues of the body into differing compartments (for example, "rapidly perfused tissues"), this function lumps tissues into compartments as specified by the argument 'tissuelist'. Aggregate flows, volumes, and partition coefficients are provided for the lumped tissue compartments. Flows and volumes are summed while partition coefficients is calculated using averaging weighted by species-specific tissue volumes.

The name of each entry in 'tissuelist' is its own compartment. The modelinfo_MODEL.R file corresponding to the model specified by argument 'model' includes both a 'tissuelist' describing to the model's compartmentallumping schme as well as a vector of 'tissuenames' specifying all tissues to be lumped into those compartments.

Alternatively the 'tissuelist' and 'tissuenames' can also be manually specified for alternate lumping schemes not necessarily related to a pre-made httk model. For example, tissuelist<-list(Rapid=c("Brain", "Kidney")).

The tissues contained in 'tissuenames' that are unused in 'tissuelist' are aggregated into a single compartment termed "rest".

NOTE: The partition coefficients of lumped compartments vary according to individual and species differences since the volumes of the consitutent tissues may vary.

232 lump_tissues

Usage

```
lump_tissues(
  Ktissue2pu.in,
  parameters = NULL,
  tissuelist = NULL,
  species = "Human",
  tissue.vols = NULL,
  tissue.flows = NULL,
  tissuenames = NULL,
  model = "pbtk",
  suppress.messages = FALSE
)
```

Arguments

Ktissue2pu.in List of partition coefficients from predict_partitioning_schmitt. The tis-

sues named in this list are lumped into the compartments specified by ${\tt tissuelist}$

unless they are not present the specified model's associated alltissues.

parameters A list of physiological parameters including flows and volumes for tissues named

in Ktissue2pu.in

tissuelist Manually specifies compartment names and tissues, which override the standard

compartment names and tissues that are usually specified in a model's associated modelinfo file. Remaining tissues in the model's associated alltissues listing

are lumped in the rest of the body.

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

tissue.vols A list of volumes for tissues in tissuelist.
tissue.flows A list of flows for tissues in tissuelist.

tissuenames A list of tissue names in tissuenames.

model Specify which model (and therefore which tissues) are being considered.

suppress.messages

Whether or not the output message is suppressed.

Value

Krbc2pu Ratio of concentration of chemical in red blood cells to unbound concentration

in plasma.

Krest2pu Ratio of concentration of chemical in rest of body tissue to unbound concentra-

tion in plasma.

Vrestc Volume of the rest of the body per kg body weight, L/kg BW.

Vliverc Volume of the liver per kg body weight, L/kg BW.

Qtotal.liverf Fraction of cardiac output flowing to the gut and liver, i.e. out of the liver.

Qgutf Fraction of cardiac output flowing to the gut.

Qkidneyf Fraction of cardiac output flowing to the kidneys.

lung_mass_children

Predict lung mass for children

Description

For individuals under 18, predict the liver mass from height, weight, and gender, using equations from Ogiu et al. 1997

Usage

```
lung_mass_children(height, weight, gender)
```

Arguments

```
height Vector of heights in cm.

weight Vector of weights in kg.

gender Vector of genders (either 'Male' or 'Female').
```

Value

A vector of lung masses in kg.

mcnally_dt

Reference tissue masses and flows from tables in McNally et al. 2014.

Description

Reference tissue masses, flows, and residual variance distributions from Tables 1, 4, and 5 of McNally et al. 2014.

Usage

mcnally_dt

Format

A data.table with variables:

tissue Body tissue

gender Gender: Male or Female

mass_ref Reference mass in kg, from Reference Man

mass_cv Coefficient of variation for mass

mass_dist Distribution for mass: Normal or Log-normal

flow_ref Reference flow in L/h, from Reference Man

flow_cv Coefficient of variation for flow (all normally distributed)

height_ref Reference heights (by gender)

CO_ref Reference cardiac output by gender

flow_frac Fraction of CO flowing to each tissue: flow_ref/CO_ref

mecdt

Pre-processed NHANES data.

Description

NHANES data on demographics, anthropometrics, and some laboratory measures, cleaned and combined into a single data set.

Usage

mecdt

Format

A data table with 23620 rows and 12 variables.

seqn NHANES unique identifier for individual respondents.

sddsrvyr NHANES two-year cycle: one of "NHANES 2013-2014", "NHANES 2015-2016", "NHANES 2017-2018".

riagendr Gender: "Male" or "Female"

ridreth1 Race/ethnicity category: one of "Mexican American", "Non-Hispanic White", "Non-Hispanic Black", "Other", "Other Hispanic".

ridexagm Age in months at the time of examination (if not recorded by NHANES, it was imputed based on age at the time of screening)

ridexagy Age in years at the time of examination (if not recorded by NHANES, it was imputed based on age at the time of screening)

bmxwt Weight in kg

lbxscr Serum creatinine, mg/dL

lbxhct Hematocrit, percent by volume of blood composed of red blood cells

wtmec6yr 6-year sample weights for combining 3 cycles, computed by dividing 2-year sample weights by 3.

bmxhtlenavg Average of height and recumbent length if both were measured; if only one was measured, takes value of the one that was measured.

weight_class One of Underweight, Normal, Overweight, or Obese. Assigned using methods in get_weight_class.

monte_carlo 237

monte_carlo

Monte Carlo for toxicokinetic model parameters

Description

This function performs basic, uncorrelated Monte Carlo to simulate uncertainty and/or variability for parameters of toxicokinetic models. Parameters can be varied according to either a normal distribution that is truncated at zero (using argument cv.params) or from a normal distribution that is censored for values less than the limit of detection (censored.params). Coefficient of variation (cv) and limit of detectin can be specified separately for each parameter.

Usage

```
monte_carlo(
  parameters,
  cv.params = NULL,
  censored.params = NULL,
  samples = 1000,
  suppress.messages = TRUE
)
```

Arguments

parameters

These parameters that are also listed in either cv.params or censored.params are sampled using Monte Carlo.

cv.params

The parameters listed in cv.params are sampled from a normal distribution that is truncated at zero. This argument should be a list of coefficients of variation (cv) for the normal distribution. Each entry in the list is named for a parameter in "parameters". New values are sampled with mean equal to the value in "parameters" and standard deviation equal to the mean times the cv.

censored.params

The parameters listed in censored.params are sampled from a normal distribution that is censored for values less than the limit of detection (specified separately for each parameter). This argument should be a list of sub-lists. Each sublist is named for a parameter in "params" and contains two elements: "cv" (coefficient of variation) and "LOD" (limit of detection), below which parameter values are censored. New values are sampled with mean equal to the value in "params" and standard deviation equal to the mean times the cv. Censored values are sampled on a uniform distribution between 0 and the limit of detection.

samples

This argument is the number of samples to be generated for calculating quantiles.

suppress.messages

Whether or not the output message is suppressed.

Value

A data.table with a row for each individual in the sample and a column for each parater in the model.

Examples

```
#Example based on Pearce et al. (2017):
# Set up means:
params <- parameterize_pbtk(chem.name="zoxamide")</pre>
# Nothing changes:
monte_carlo(params)
vary.params <- NULL
for (this.param in names(params)[!(names(params) %in%
  c("Funbound.plasma", "pKa_Donor", "pKa_Accept" )) &
  !is.na(as.numeric(params))]) vary.params[this.param] <- 0.2</pre>
# Most everything varies with CV of 0.2:
monte_carlo(
  parameters=params,
  cv.params = vary.params)
censored.params <- list(Funbound.plasma = list(cv = 0.2, lod = 0.01))</pre>
# Fup is censored below 0.01:
monte_carlo(
  parameters=params,
  cv.params = vary.params,
  censored.params = censored.params)
```

0bach2008

Published Pharmacokinetic Parameters from Obach et al. 2008

Description

This data set is used in Vignette 4 for steady state concentration.

Usage

0bach2008

Format

A data.frame containing 670 rows and 8 columns.

onlyp 239

References

Obach, R. Scott, Franco Lombardo, and Nigel J. Waters. "Trend analysis of a database of intravenous pharmacokinetic parameters in humans for 670 drug compounds." Drug Metabolism and Disposition 36.7 (2008): 1385-1405.

onlyp

NHANES Exposure Data

Description

This data set is only used in Vignette 6.

Usage

onlyp

Format

A data.table containing 1060 rows and 5 columns.

```
pancreas_mass_children
```

Predict pancreas mass for children

Description

For individuals under 18, predict the pancreas mass from height, weight, and gender, using equations from Ogiu et al.

Usage

```
pancreas_mass_children(height, weight, gender)
```

Arguments

| height | Vector of heights in cm. |
|--------|--------------------------|
| weight | Vector of weights in kg. |

gender Vector of genders (either 'Male' or 'Female').

240 parameterize_1comp

Value

A vector of pancreas masses in kg.

parameterize_1comp

Parameters for a one compartment (empirical) toxicokinetic model

Description

This function initializes the parameters needed in the function solve_1comp. Volume of distribution is estimated by using a modified Schmitt (2008) method to predict tissue particition coefficients (Pearce et al., 2017) and then lumping the compartments weighted by tissue volume:

Usage

```
parameterize_1comp(
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  species = "Human",
  default.to.human = FALSE,
  adjusted.Funbound.plasma = TRUE,
  adjusted.Clint = TRUE,
  regression = TRUE,
  restrictive.clearance = TRUE,
  well.stirred.correction = TRUE,
  suppress.messages = FALSE,
  clint.pvalue.threshold = 0.05,
  minimum.Funbound.plasma = 1e-04,
  class.exclude = TRUE,
  physchem.exclude = TRUE,
  Caco2.options = list(),
)
```

parameterize_1comp 241

Arguments

chem.cas Chemical Abstract Services Registry Number (CAS-RN) – the chemical must

be identified by either CAS, name, or DTXISD

chem. name Chemical name (spaces and capitalization ignored) – the chemical must be iden-

tified by either CAS, name, or DTXISD

dtxsid EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) - the

chemical must be identified by either CAS, name, or DTXSIDs

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

default.to.human

Substitutes missing rat values with human values if true.

adjusted.Funbound.plasma

Uses Pearce et al. (2017) lipid binding adjustment for Funbound.plasma (which impacts volume of distribution) when set to TRUE (Default).

adjusted.Clint Uses Kilford et al. (2008) hepatocyte incubation binding adjustment for Clint when set to TRUE (Default).

regression Whether or not to use the regressions in calculating partition coefficients in vol-

ume of distribution calculation. restrictive.clearance

In calculating elimination rate and hepatic bioavailability, protein binding is not taken into account (set to 1) in liver clearance if FALSE.

well.stirred.correction

Uses correction in calculation of hepatic clearance for well-stirred model if TRUE. This assumes clearance relative to amount unbound in whole blood instead of plasma, but converted to use with plasma concentration.

suppress.messages

Whether or not to suppress messages.

clint.pvalue.threshold

Hepatic clearance for chemicals where the in vitro clearance assay result has a p-value greater than the threshold are set to zero.

minimum.Funbound.plasma

Monte Carlo draws less than this value are set equal to this value (default is 0.0001 – half the lowest measured Fup in our dataset).

class.exclude Exclude chemical classes identified as outside of domain of applicability by relevant modelinfo_[MODEL] file (default TRUE).

physchem.exclude

Exclude chemicals on the basis of physico-chemical properties (currently only Henry's law constant) as specified by the relevant modelinfo_[MODEL] file (default TRUE).

otherwise fgut.oral = Fgut. overwrite.invivo = TRUE overwrites Fabs and Fgut

Caco2.options A list of options to use when working with Caco2 apical to basolateral data Caco2.Pab, default is Caco2.options = list(Caco2.Pab.default = 1.6, Caco2.Fabs = TRUE, Caco2.Fgut = TRUE, overwrite.invivo = FALSE, keepit100 = FALSE). Caco2.Pab.default sets the default value for Caco2.Pab if Caco2.Pab is unavailable. Caco2.Fabs = TRUE uses Caco2.Pab to calculate fabs.oral, otherwise fabs.oral = Fabs. Caco2.Fgut = TRUE uses Caco2.Pab to calculate fgut.oral,

in vivo values from literature with Caco2 derived values if available. keepit100 = TRUE overwrites Fabs and Fgut with 1 (i.e. 100 percent) regardless of other settings. See get_fbio for further details.

. . Additional arguments, not currently used.

Details

 $V_{d.steady-state} = \sum_{i \in tissues} K_i V_i + V_{plasma}$

where K_i is the tissue:unbound plasma concentration partition coefficient for tissue i.

Because this model does not simulate exhalation, inhalation, and other processes relevant to volatile chemicals, this model is by default restricted to chemicals with a logHenry's Law Constant less than that of Acetone, a known volatile chemical. That is, chemicals with logHLC > -4.5 (Log10 atm-m3/mole) are excluded. Volatility is not purely determined by the Henry's Law Constant, therefore this chemical exclusion may be turned off with the argument "physchem.exclude = FALSE". Similarly, per- and polyfluoroalkyl substances (PFAS) are excluded by default because the transporters that often drive PFAS toxicokinetics are not included in this model. However, PFAS chemicals can be included with the argument "class.exclude = FALSE".

Value

Vdist Volume of distribution, units of L/kg BW.

Fabsgut Fraction of the oral dose absorbed and surviving gut metabolism, i.e. the fraction

of the dose that enters the gutlumen.

kelim Elimination rate, units of 1/h.

hematocrit Percent volume of red blood cells in the blood.

Fabsgut Fraction of the oral dose absorbed, i.e. the fraction of the dose that enters the

gutlumen.

Fhep.assay.correction

The fraction of chemical unbound in hepatocyte assay using the method of Kil-

ford et al. (2008)

kelim Elimination rate, units of 1/h.

hematocrit Percent volume of red blood cells in the blood.

kgutabs Rate chemical is absorbed, 1/h.

million.cells.per.gliver

Millions cells per gram of liver tissue.

MW Molecular Weight, g/mol.

Rblood2plasma The ratio of the concentration of the chemical in the blood to the concentration

in the plasma. Not used in calculations but included for the conversion of plasma

outputs.

hepatic.bioavailability

Fraction of dose remaining after first pass clearance, calculated from the cor-

rected well-stirred model.

BW Body Weight, kg.

Examples

Description

This function initializes the parameters needed in the functions solve_ltri_pbtk by calling parameterize_pbtk and adding additional parameters.

Usage

```
parameterize_1tri_pbtk(
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  species = "Human",
  return.kapraun2019 = TRUE,
  suppress.messages = FALSE,
  ...
)
```

Arguments

chem. cas Either the chemical name or the CAS number must be specified. chem. name Either the chemical name or the CAS number must be specified.

dtxsid EPA's DSSTox Structure ID (http://comptox.epa.gov/dashboard) the chem-

ical must be identified by either CAS, name, or DTXSIDs

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

Currently only a human model is supported.

return.kapraun2019

If TRUE (default), empirical parameters from Kapraun et al. (2019) necessary for defining the model are provided. This is a subset of the httk::kapraun2019

list object with additional parameters.

suppress.messages

Whether or not the output message is suppressed.

... Arguments passed to parameterize_pbtk.

Details

Because this model does not simulate exhalation, inhalation, and other processes relevant to volatile chemicals, this model is by default restricted to chemicals with a logHenry's Law Constant less than that of Acetone, a known volatile chemical. That is, chemicals with logHLC > -4.5 (Log10 atm-m3/mole) are excluded. Volatility is not purely determined by the Henry's Law Constant, therefore this chemical exclusion may be turned off with the argument "physchem.exclude = FALSE". Similarly, per- and polyfluoroalkyl substances (PFAS) are excluded by default because the transporters that often drive PFAS toxicokinetics are not included in this model. However, PFAS chemicals can be included with the argument "class.exclude = FALSE".

Value

pre_pregnant_BW

Body Weight before pregnancy, kg.

Clmetabolismc Hepatic Clearance, L/h/kg BW.

Fabsgut Fraction of the oral dose absorbed, i.e. the fraction of the dose that enters the

gutlumen.

Funbound.plasma

Fraction of plasma that is not bound.

Fhep.assay.correction

The fraction of chemical unbound in hepatocyte assay using the method of Kil-

ford et al. (2008)

hematocrit Percent volume of red blood cells in the blood.

Kadipose2pu Ratio of concentration of chemical in adipose tissue to unbound concentration

in plasma.

Kconceptus2pu_initial

Ratio of concentration of chemical in "conceptus" compartment to unbound con-

centration in plasma at time 0.

Kconceptus2pu_final

Ratio of concentration of chemical in "conceptus" compartment to unbound con-

centration in plasma at 13 weeks.

Kgut2pu Ratio of concentration of chemical in gut tissue to unbound concentration in

plasma.

kgutabs Rate that chemical enters the gut from gutlumen, 1/h.

Kkidney2pu Ratio of concentration of chemical in kidney tissue to unbound concentration in

plasma.

Kliver2pu Ratio of concentration of chemical in liver tissue to unbound concentration in

plasma.

Klung2pu Ratio of concentration of chemical in lung tissue to unbound concentration in

plasma.

Krbc2pu Ratio of concentration of chemical in red blood cells to unbound concentration

in plasma.

Krest2pu Ratio of concentration of chemical in rest of body tissue to unbound concentra-

tion in plasma.

Kthyroid2pu Ratio of concentration of chemical in thyroid tissue to unbound concentration in

plasma.

million.cells.per.gliver

Millions cells per gram of liver tissue.

MW Molecular Weight, g/mol. pH_Plasma_mat pH of the maternal plasma.

Qgfr Glomerular Filtration Rate, L/h/kg BW^3/4, volume of fluid filtered from kidney

and excreted.

Vgutc Volume of the gut per kg body weight, L/kg BW.

| Vkidneyc | Volume of the kidneys per kg body weight, L/kg BW. |
|-----------|--|
| Vliverc | Volume of the liver per kg body weight, L/kg BW. |
| Vlungc | Volume of the lungs per kg body weight, L/kg BW. |
| Vthyroidc | Volume of the thyroid per kg body weight, L/kg BW. |

parameterize_3comp 247

parameterize_3comp

Parameters for a three-compartment toxicokinetic model (dynamic)

Description

This function generates the chemical- and species-specific parameters needed for model '3compartment', for example solve_3comp. A call is masde to parameterize_pbtk to use Schmitt (2008)'s method as modified by Pearce et al. (2017) to predict partition coefficients based on descriptions in tissue.data. Organ volumes and flows are retrieved from table physiology.data.

Usage

```
parameterize_3comp(
  chem.cas = NULL,
  chem.name = NULL,
 dtxsid = NULL,
  species = "Human",
  default.to.human = FALSE,
  class.exclude = TRUE,
  physchem.exclude = TRUE,
  force.human.clint.fup = FALSE,
  clint.pvalue.threshold = 0.05,
  adjusted.Funbound.plasma = TRUE,
  adjusted.Clint = TRUE,
  regression = TRUE,
  suppress.messages = FALSE,
  restrictive.clearance = TRUE,
 minimum.Funbound.plasma = 1e-04,
 Caco2.options = NULL,
)
```

Arguments

| chem.cas | Chemical Abstract Services Registry Number (CAS-RN) – the chemical must be identified by either CAS, name, or DTXISD | |
|------------------|--|--|
| chem.name | Chemical name (spaces and capitalization ignored) – the chemical must be identified by either CAS, name, or DTXISD | |
| dtxsid | EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) – the chemical must be identified by either CAS, name, or DTXSIDs | |
| species | Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human"). | |
| default.to.human | | |
| | Substitutes missing animal values with human values if true. | |
| class.exclude | Exclude chemical classes identified as outside of domain of applicability by relevant modelinfo_[MODEL] file (default TRUE). | |

248 parameterize_3comp

physchem.exclude

Exclude chemicals on the basis of physico-chemical properties (currently only Henry's law constant) as specified by the relevant modelinfo_[MODEL] file (default TRUE).

force.human.clint.fup

Forces use of human values for hepatic intrinsic clearance and fraction of unbound plasma if true.

clint.pvalue.threshold

Hepatic clearances with clearance assays having p-values greater than the threshold are set to zero.

adjusted.Funbound.plasma

Uses Pearce et al. (2017) lipid binding adjustment for Funbound.plasma (which impacts partition coefficients) when set to TRUE (Default).

adjusted.Clint Uses Kilford et al. (2008) hepatocyte incubation binding adjustment for Clint when set to TRUE (Default).

regression Whether or not to use the regressions in calculating partition coefficients. suppress.messages

Whether or not the output message is suppressed.

restrictive.clearance

In calculating hepatic.bioavailability, protein binding is not taken into account (set to 1) in liver clearance if FALSE.

minimum.Funbound.plasma

Monte Carlo draws less than this value are set equal to this value (default is 0.0001 – half the lowest measured Fup in our dataset).

Caco2.options

A list of options to use when working with Caco2 apical to basolateral data Caco2.Pab, default is Caco2.options = list(Caco2.Pab.default = 1.6, Caco2.Fabs = TRUE, Caco2.Fgut = TRUE, overwrite.invivo = FALSE, keepit100 = FALSE). Caco2.Pab.default sets the default value for Caco2.Pab if Caco2.Pab is unavailable. Caco2.Fabs = TRUE uses Caco2.Pab to calculate fabs.oral, otherwise fabs.oral = Fabs. Caco2.Fgut = TRUE uses Caco2.Pab to calculate fgut.oral, otherwise fgut.oral = Fgut. overwrite.invivo = TRUE overwrites Fabs and Fgut in vivo values from literature with Caco2 derived values if available. keepit100 = TRUE overwrites Fabs and Fgut with 1 (i.e. 100 percent) regardless of other settings. See get_fbio for further details.

.. Additional arguments, not currently used.

Details

Because this model does not simulate exhalation, inhalation, and other processes relevant to volatile chemicals, this model is by default restricted to chemicals with a logHenry's Law Constant less than that of Acetone, a known volatile chemical. That is, chemicals with logHLC > -4.5 (Log10 atm-m3/mole) are excluded. Volatility is not purely determined by the Henry's Law Constant, therefore this chemical exclusion may be turned off with the argument "physchem.exclude = FALSE". Similarly, per- and polyfluoroalkyl substances (PFAS) are excluded by default because the transporters that often drive PFAS toxicokinetics are not included in this model. However, PFAS chemicals can be included with the argument "class.exclude = FALSE".

parameterize_3comp 249

Value

BW Body Weight, kg.

Clmetabolismc Hepatic Clearance, L/h/kg BW.

Fabsgut Fraction of the oral dose absorbed, i.e. the fraction of the dose that enters the

gutlumen.

Funbound.plasma

Fraction of plasma that is not bound.

Fhep.assay.correction

The fraction of chemical unbound in hepatocyte assay using the method of Kil-

ford et al. (2008)

hematocrit Percent volume of red blood cells in the blood.

Kgut2pu Ratio of concentration of chemical in gut tissue to unbound concentration in

plasma.

BW Body Weight, kg.

Clmetabolismc Hepatic Clearance, L/h/kg BW.

Fabsgut Fraction of the oral dose absorbed, i.e. the fraction of the dose that enters the

gutlumen.

Funbound.plasma

Fraction of plasma that is not bound.

Fhep.assay.correction

The fraction of chemical unbound in hepatocyte assay using the method of Kil-

ford et al. (2008)

hematocrit Percent volume of red blood cells in the blood.

Kgut2pu Ratio of concentration of chemical in gut tissue to unbound concentration in

plasma.

Kliver2pu Ratio of concentration of chemical in liver tissue to unbound concentration in

plasma.

parameterize_3comp2 253

Krbc2pu Ratio of concentration of chemical in red blood cells to unbound concentration

in plasma.

Krest2pu Ratio of concentration of chemical in rest of body tissue to unbound concentra-

tion in plasma.

million.cells.per.gliver

Millions cells per gram of liver tissue.

MW Molecular Weight, g/mol.

Qcardiacc Cardiac Output, L/h/kg BW^3/4.

Qgfrc Glomerular Filtration Rate, L/h/kg BW^3/4, volume of fluid filtered from kidney

and excreted.

Qgutf Fraction of cardiac output flowing to the gut.
Qliverf Fraction of cardiac output flowing to the liver.

Rblood2plasma The ratio of the concentration of the chemical in the blood to the concentration

in the plasma.

Vgutc Volume of the gut per kg body weight, L/kg BW.
Vliverc Volume of the liver per kg body weight, L/kg BW.

Vrestc Volume of the rest of the body per kg body weight, L/kg BW.

parameterize_armitage Parameterize Armitage In Vitro Distribution Model

Description

Parameterize Armitage In Vitro Distribution Model

Usage

```
parameterize_armitage(tcdata = NA, casrn.vector = NA_character_)
```

Arguments

| tcdata | A data.table with casrn, nomconc, MP, gkow, gkaw, gswat, sarea, v_total, v_working. |
|--------------|---|
| | Otherwise supply single values to this.params (e.g., this.sarea, this.v_total, etc.). |
| | Chemical parameters are taken from chem.physical_and_invitro.data. |
| casrn.vector | A deprecated argument specifying a single or vector of Chemical Abstracts Ser- |
| | vice Registry Number(s) (CAS-RN) of desired chemical(s). |

Value

| Param | Description | Units |
|------------|---|----------------------|
| casrn | Chemical Abstracts Service Registry Number | character |
| logHenry | The log10 Henry's law constant | atm*m^3/mol |
| MP_C | The chemical compound's melting point | degrees C |
| MW | The chemical compound's molecular weight | g/mol |
| gkow_n | The log10 octanol to water (PC) (logP) | log10 unitless ratio |
| pKa_Donor | Chemical dissociation equilibrium constant(s); pKa(ie pKa_Donor) = -log10(Ka) | unitless |
| pKa_Accept | Chemical association equilibrium constant(s); pKb(ie pKa_Accept) = 14 - pKa | unitless |
| pН | pH where ionization is evaluated (typically assay medium) | unitless |
| gkaw_n | The air to water PC (neutral) | unitless ratio |
| gswat_n | The log10 water solubility at 25C (logWSol) | log10 mg/L |
| | | |

  restrictive.clearance = TRUE,
 minimum.Funbound.plasma = 1e-04,
  skin_depth = 0.12,
  skin.pH = 7,
 BW = NULL,
 height = 175,
  totalSA = NULL,
 Kvehicle2water = "water",
  InfiniteDose = 0.
 million.cells.per.gliver = 110,
  liver.density = 1.05,
  kgutabs = 2.18,
```

```
Caco2.options = NULL
```

Arguments

chem.cas

Either the chemical name or the CAS number must be specified.

chem.name

Either the chemical name or the CAS number must be specified. Parameters include tissue:plasma partition coefficients, organ volumes, and flows for the tissue lumping scheme specified by argument tissuelist. Tissure:(fraction unbound in) plasma partitition coefficients are predicted via Schmitt (2008)'s method as modified by Pearce et al. (2017) using predict_partitioning_schmitt. Organ volumes and flows are retrieved from table physiology. data. Tissues must be described in table tissue.data.

By default, this function initializes the parameters needed in the functions solve_pbtk, calc_css, and others using the httk default generic PBTK model (for oral and intravenous dosing only).

The default PBTK model includes an explicit first pass of the chemical through the liver before it becomes available to systemic blood. We model systemic oral bioavailability as $F_{bio} = F_{abs} * F_{gut} * F_{hep}$. Only if F_{bio} has been measured in vivo and is found in table ${\sf chem.physical_and_invitro.data}$ then we set $F_{abs} * F_{qut}$ to the measured value divided by F_{hep} where F_{hep} is estimated from in vitro TK data using calc_hep_bioavailability. If Caco2 membrane permeability data or predictions are available F_{abs} is estimated using calc_fabs.oral. Intrinsic hepatic metabolism is used to very roughly estimate F_{gut} using calc_fgut.oral.

dtxsid

EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chemical must be identified by either CAS, name, or DTXSIDs.

model.type

Choice of dermal model, either the default "dermal_1subcomp" for the model with 1 compartment for the skin; or (not usable yet) "dermal" for the model with 2 sub compartments (a sc and ed layer) for skin which defaults to the sc layer being the stratum corneum and the ed layer being the combined viable epidermis and dermis.

method.permeability

For "dermal_1subcomp" model, method of calculating the permeability coefficient, P, either "Potts-Guy" or "UK-Surrey". Default is "UK-Surrey" (Sawyer et al., 2016 and Chen et al., 2015), which uses Fick's law of diffusion to calculate P. For "dermal" model, this parameter is ignored.

Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human"). default.to.human

> Substitutes missing animal values with human values if true (hepatic intrinsic clearance or fraction of unbound plasma).

tissuelist

Specifies compartment names and tissues groupings. Remaining tissues in tissue.data are lumped in the rest of the body. However, solve_dermal_pbtk only works with the default parameters.

force.human.clint.fup

Forces use of human values for hepatic intrinsic clearance and fraction of unbound plasma if true.

species

clint.pvalue.threshold

Hepatic clearance for chemicals where the in vitro clearance assay result has a p-values greater than the threshold are set to zero.

adjusted.Funbound.plasma

Uses Pearce et al. (2017) lipid binding adjustment for Funbound.plasma (which impacts partition coefficients) when set to TRUE (Default).

adjusted. Clint Uses Kilford et al. (2008) hepatocyte incubation binding adjustment for Clint when set to TRUE (Default).

regression Whether or not to use the regressions in calculating partition coefficients. suppress.messages

Whether or not the output message is suppressed.

restrictive.clearance

In calculating hepatic.bioavailability, protein binding is not taken into account (set to 1) in liver clearance if FALSE.

minimum.Funbound.plasma

Monte Carlo draws less than this value are set equal to this value (default is 0.0001 – half the lowest measured Fup in our dataset).

skin_depth skin_depth of skin, cm, used in calculating P.

skin.pH pH of dermis/skin, used in calculating P and Kskin2vehicle.

BW Body weight (kg)

height Height in cm, used in calculating totalSA.

totalSA Total body surface area (cm²)

Kvehicle2water Partition coefficient for the vehicle (sometimes called the vehicle) carrying the chemical to water. Default is "water", which assumes the vehicle is water. Other

optional inputs are "octanol", "olive oil", or a numeric value.

InfiniteDose If TRUE, we assume infinite dosing (i.e., a constant unchanging concentration of chemical in the vehicle is considered) and Cvehicle is a constant. If FALSE

(default), dosing is finite and Cvehicle changes over time.

million.cells.per.gliver

Hepatocellularity (defaults to 110 10\(^6\) cells/g-liver, from Carlile et al. (1997))

Liver density (defaults to 1.05 g/mL from International Commission on Radioliver.density logical Protection (1975))

kgutabs Oral absorption rate from gut (defaults to 2.18 1/h from Wambaugh et al. (2018))

Caco2.options

A list of options to use when working with Caco2 apical to basolateral data Caco2.Pab, default is Caco2.options = list(Caco2.default = 2, Caco2.Fabs = TRUE, Caco2.Fgut = TRUE, overwrite.invivo = FALSE, keepit100 = FALSE). Caco2.default sets the default value for Caco2.Pab if Caco2.Pab is unavailable. Caco2.Fabs = TRUE uses Caco2.Pab to calculate fabs.oral, otherwise fabs.oral = Fabs. Caco2.Fgut = TRUE uses Caco2.Pab to calculate fgut.oral, otherwise fgut.oral = Fgut. overwrite.invivo = TRUE overwrites Fabs and Fgut in vivo values from literature with Caco2 derived values if available. keepit100 = TRUE overwrites Fabs and Fgut with 1 (i.e. 100 percent) regardless of other settings.

Value

BW Body Weight, kg.

Clmetabolismc Hepatic Clearance, L/h/kg BW.

Fgutabs Fraction of the oral dose absorbed, i.e. the fraction of the dose that enters the

gutlumen.

Fhep.assay.correction

The fraction of chemical unbound in hepatocyte assay using the method of Kil-

ford et al.(2008)

Fskin_depth_sc Fraction of skin depth in strateum corneum so that the depth of the SC is Fskin_depth_sc*skin_depth.

This parameter does not appear when model.type="dermal_1subcomp".

Fskin_depth_ed Fraction of skin depth in combined viable epidermis and dermis so that the depth

of the ED is Fskin_depth_ed*skin_depth. This parameter does not appear when

model.type="dermal_1subcomp".

Fskin_exposed Fraction of skin exposed.

Funbound.plasma

Fraction of plasma that is not bound.

hematocrit Percent volume of red blood cells in the blood.

InfiniteDose If InfiniteDose=1, infinite dosing is assumed and Cvehicle_infinite is used in

place of Cvehicle; if InfiniteDose=0, finite dosing is assumed and Avehicle is used for dosing. When InfiniteDose=1, the state variable Avehicle does not

have meaning.

Kblood2air Ratio of concentration of chemical in blood to air, calculated using calc_kair.

Kgut2pu Ratio of concentration of chemical in gut tissue to unbound concentration in

plasma.

kgutabs Rate that chemical enters the gut from gutlumen, 1/h.

Kkidney2pu Ratio of concentration of chemical in kidney tissue to unbound concentration in

plasma.

Kliver2pu Ratio of concentration of chemical in liver tissue to unbound concentration in

plasma.

Klung2pu Ratio of concentration of chemical in lung tissue to unbound concentration in

plasma.

Krbc2pu Ratio of concentration of chemical in red blood cells to unbound concentration

in plasma.

Krest2pu Ratio of concentration of chemical in rest of body tissue to unbound concentra-

tion in plasma.

Kskin2pu Ratio of concentration of chemical in skin tissue to unbound concentration in

plasma.

Kskin2vehicle Partition coefficient between exposed skin and vehicle. This parameter only

appears when model.type="dermal_1subcomp" and is replaced by Ksc2vehicle

when model.type="dermal".

Ksc2vehicle Partition coefficient between SC and vehicle. This parameter does not appear

when model.type="dermal_1subcomp".

Ksc2ed Partition coefficient between ED and SC. This parameter does not appear when

model.type="dermal_1subcomp".

MA ?

million.cells.per.gliver

Millions cells per gram of liver tissue.

MW Molecular Weight, g/mol.

P Permeability of the skin, cm/h. When model.type="dermal_1subcomp", this pa-

rameter changes depending on method.permeability. When model.type="dermal",

this parameter is replaced by Pvehicle2sc and Psc2ed.

Pvehicle2sc Permeability of the stratum corneum (SC), cm/h. This parameter does not ap-

pear when model.type="dermal_1subcomp".

Psc2ed Permeability of the combined viable epidermis and dermis layer of the skin

("ed"), cm/h. This parameter does not appear when model.type="dermal_1subcomp".

Qalvc Unscaled alveolar ventilation rate, L/h/kg BW^3/4.

Qcardiacc Cardiac Output, L/h/kg BW^3/4.

Qgfrc Glomerular Filtration Rate, L/h/kg BW^3/4, volume of fluid filtered from kidney

and excreted.

Qgutf Fraction of cardiac output flowing to the gut.

Qkidneyf Fraction of cardiac output flowing to the kidneys.

Qliverf Fraction of cardiac output flowing to the liver.

Qlungf Fraction of cardiac output flowing to the lung.

Qskinf Fraction of cardiac output flowing to the skin, or to the ed layer of the skin when

model.type="dermal".

Rblood2plasma The ratio of the concentration of the chemical in the blood to the concentration

in the plasma from available_rblood2plasma.

skin_depth Skin depth, cm.

totalSA Total body surface area, cm^2.

Volume of the arteries per kg body weight, L/kg BW.

Vgutc

Volume of the gut per kg body weight, L/kg BW.

Vkidneyc

Volume of the kidneys per kg body weight, L/kg BW.

Vliverc

Volume of the liver per kg body weight, L/kg BW.

Vlungc

Volume of the lungs per kg body weight, L/kg BW.

Vrestc Volume of the rest of the body per kg body weight, L/kg BW.

Vvenc Volume of the veins per kg body weight, L/kg BW.
Vskinc Volume of the skin per kg body weight, L/kg BW.

Vskin_scc Volume of the sc or upper layer of the skin per kg body weight, L/kg BW. This

parameter does not appear when model.type="dermal_1subcomp".

Vskin_edc Volume of the combined viable epidermis and dermis layer of the skin per kg

body weight, L/kg BW. This parameter does not appear when model.type="dermal_1subcomp".

```

Description

This function initializes the parameters needed in the functions solve_fetal_pbtk by calling parameterize_pbtk and adding additional parameters.

Usage

```
parameterize_fetal_pbtk(
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  species = "Human",
  fetal_fup_adjustment = TRUE,
  return.kapraun2019 = TRUE,
  suppress.messages = FALSE,
  ...
)
```

Arguments

chem. cas Either the chemical name or the CAS number must be specified.

chem. name Either the chemical name or the CAS number must be specified.

dtxsid EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chem-

ical must be identified by either CAS, name, or DTXSIDs

species Included for compatibility with other functions, but the model will not run for

non-human species (default "Human").

fetal_fup_adjustment

Logical indicator of whether to use an adjusted estimate for fetal fup based on the fetal:maternal plasma protein binding ratios presented in McNamara and Alcorn's 2002 study "Protein Binding Predictions in Infants." Defaults to TRUE.

return.kapraun2019

If TRUE (default) the empirical parameters for the Kapraun et al. (2019) maternalfetal growth parameters are provided.

suppress.messages

Whether or not the output message is suppressed.

... Arguments passed to parameterize_pbtk.

Details

Because this model does not simulate exhalation, inhalation, and other processes relevant to volatile chemicals, this model is by default restricted to chemicals with a logHenry's Law Constant less than that of Acetone, a known volatile chemical. That is, chemicals with logHLC > -4.5 (Log10 atm-m3/mole) are excluded. Volatility is not purely determined by the Henry's Law Constant, therefore this chemical exclusion may be turned off with the argument "physchem.exclude = FALSE". Similarly, per- and polyfluoroalkyl substances (PFAS) are excluded by default because the transporters that often drive PFAS toxicokinetics are not included in this model. However, PFAS chemicals can be included with the argument "class.exclude = FALSE".

Value

```
pre_pregnant_BW

Body Weight before pregnancy, kg.

Clmetabolismc Hepatic Clearance, L/h/kg BW.
```

Fabsgut Fraction of the oral dose absorbed, i.e. the fraction of the dose that enters the

gutlumen.

Funbound.plasma

Fraction of plasma that is not bound.

Fhep.assay.correction

The fraction of chemical unbound in hepatocyte assay using the method of Kil-

ford et al. (2008)

hematocrit Percent volume of red blood cells in the blood.

Kadipose2pu Ratio of concentration of chemical in adipose tissue to unbound concentration

in plasma.

Kgut2pu Ratio of concentration of chemical in gut tissue to unbound concentration in

plasma.

kgutabs Rate that chemical enters the gut from gutlumen, 1/h.

Kkidney2pu Ratio of concentration of chemical in kidney tissue to unbound concentration in

plasma.

Kliver2pu Ratio of concentration of chemical in liver tissue to unbound concentration in

plasma.

Klung2pu Ratio of concentration of chemical in lung tissue to unbound concentration in

plasma.

Krbc2pu Ratio of concentration of chemical in red blood cells to unbound concentration

in plasma.

tion in plasma.

Kthyroid2pu Ratio of concentration of chemical in thyroid tissue to unbound concentration in

plasma.

Kfgut2pu Ratio of concentration of chemical in fetal gut tissue to unbound concentration

in plasma.

Kfkidney2pu Ratio of concentration of chemical in fetal kidney tissue to unbound concentra-

tion in plasma.

Kfliver2pu Ratio of concentration of chemical in fetal liver tissue to unbound concentration

in plasma.

Kflung2pu Ratio of concentration of chemical in fetal lung tissue to unbound concentration

in plasma.

Kfrest2pu Ratio of concentration of chemical in fetal rest of body tissue to unbound con-

centration in plasma.

Kfbrain2pu Ratio of concentration of chemical in fetal brain tissue to unbound concentration

in plasma.

Kfthyroid2pu Ratio of concentration of chemical in fetal thyroid tissue to unbound concentra-

tion in plasma.

Kplacenta2pu Ratio of concentration of chemical in placental tissue to unbound concentration

in maternal plasma.

Kfplacenta2pu Ratio of concentration of chemical in placental tissue to unbound concentration

in fetal plasma.

million.cells.per.gliver

Millions cells per gram of liver tissue.

MW Molecular Weight, g/mol. pH_Plasma_mat pH of the maternal plasma.

Qgfr Glomerular Filtration Rate, L/h/kg BW^3/4, volume of fluid filtered from kidney

and excreted.

Rblood2plasma The ratio of the concentration of the chemical in the blood to the concentration

in the plasma from available rblood2plasma.

Vgutc Volume of the gut per kg body weight, L/kg BW.

Vkidneyc Volume of the kidneys per kg body weight, L/kg BW.

Vliverc Volume of the liver per kg body weight, L/kg BW.

Examples

parameterize_gas_pbtk Parameters for a generic gas inhalation physiologically-based toxicokinetic model

Description

This function initializes the parameters needed for the model 'gas_pbtk', for example solve_gas_pbtk. Chemical- and species-specific model parameters are generated. These include tissue:plasma partition coefficients via Schmitt (2008)'s method as modified by Pearce et al. (2017). Organ volumes and flows are retrieved from table physiology.data). This model was first described by Linakis et al. (2020).

Usage

```
parameterize_gas_pbtk(
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  species = "Human",
  default.to.human = FALSE,
 tissuelist = list(liver = c("liver"), kidney = c("kidney"), lung = c("lung"), gut =
    c("gut")),
  force.human.clint.fup = FALSE,
  clint.pvalue.threshold = 0.05,
  adjusted.Funbound.plasma = TRUE,
  adjusted.Clint = TRUE,
  regression = TRUE,
  vmax = 0,
  km = 1,
  exercise = FALSE,
  fR = 12,
  VT = 0.75,
```

parameterize_gas_pbtk 265

```
VD = 0.15,
  suppress.messages = FALSE,
  minimum.Funbound.plasma = 1e-04,
  Caco2.options = list(),
  class.exclude = TRUE,
  physchem.exclude = TRUE,
  restrictive.clearance = FALSE,
  ...
)
```

Arguments

chem. cas Either the chemical name or the CAS number must be specified.

chem. name Either the chemical name or the CAS number must be specified.

dtxsid EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chem-

ical must be identified by either CAS, name, or DTXSIDs

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

default.to.human

Substitutes missing animal values with human values if true (hepatic intrinsic clearance or fraction of unbound plasma).

tissuelist Specifies compartment names and tissues groupings. Remaining tissues in tis-

sue.data are lumped in the rest of the body. However, solve_pbtk only works

with the default parameters.

force.human.clint.fup

Forces use of human values for hepatic intrinsic clearance and fraction of unbound plasma if true.

clint.pvalue.threshold

Hepatic clearance for chemicals where the in vitro clearance assay result has a p-values greater than the threshold are set to zero.

adjusted.Funbound.plasma

Uses Pearce et al. (2017) lipid binding adjustment for Funbound.plasma (which impacts partition coefficients) when set to TRUE (Default).

adjusted.Clint Uses Kilford et al. (2008) hepatocyte incubation binding adjustment for Clint

when set to TRUE (Default).

regression Whether or not to use the regressions in calculating partition coefficients.

vmax Michaelis-Menten vmax value in reactions/min

km Michaelis-Menten concentration of half-maximal reaction velocity in desired

output concentration units.

exercise Logical indicator of whether to simulate an exercise-induced heightened respi-

ration rate

fR Respiratory frequency (breaths/minute), used especially to adjust breathing rate

in the case of exercise. This parameter, along with VT and VD (below) gives another option for calculating Qalv (Alveolar ventilation) in case pulmonary

ventilation rate is not known

VT Tidal volume (L), to be modulated especially as part of simulating the state of

exercise

VD Anatomical dead space (L), to be modulated especially as part of simulating the

state of exercise

suppress.messages

Whether or not the output messages are suppressed.

minimum.Funbound.plasma

Monte Carlo draws less than this value are set equal to this value (default is 0.0001 – half the lowest measured Fup in our dataset).

Caco2.options

A list of options to use when working with Caco2 apical to basolateral data Caco2.Pab, default is Caco2.options = list(Caco2.Pab.default = 1.6, Caco2.Fabs = TRUE, Caco2.Fgut = TRUE, overwrite.invivo = FALSE, keepit100 = FALSE). Caco2.Pab.default sets the default value for Caco2.Pab if Caco2.Pab is unavailable. Caco2.Fabs = TRUE uses Caco2.Pab to calculate fabs.oral, otherwise fabs.oral = Fabs. Caco2.Fgut = TRUE uses Caco2.Pab to calculate fgut.oral, otherwise fgut.oral = Fgut. overwrite.invivo = TRUE overwrites Fabs and Fgut in vivo values from literature with Caco2 derived values if available. keepit100 = TRUE overwrites Fabs and Fgut with 1 (i.e. 100 percent) regardless of other settings. See get_fbio for further details.

class.exclude

Exclude chemical classes identified as outside of domain of applicability by relevant modelinfo_[MODEL] file (default TRUE).

physchem.exclude

Exclude chemicals on the basis of physico-chemical properties (currently only Henry's law constant) as specified by the relevant modelinfo_[MODEL] file (default TRUE).

restrictive.clearance

Protein binding not taken into account (set to 1) in liver clearance if FALSE. (Default is FALSE.)

... Other parameters

Details

Per- and polyfluoroalkyl substances (PFAS) are excluded by default because the transporters that often drive PFAS toxicokinetics are not included in this model. However, PFAS chemicals can be included with the argument "class.exclude = FALSE".

Value

BW Body Weight, kg.

Clint Hepatic intrinsic clearance, uL/min/10⁶ cells

Clint.dist Distribution of hepatic intrinsic clearance values (median, lower 95th, upper

95th, p value)

Clmetabolismc Hepatic Clearance, L/h/kg BW.

Fabsgut Fraction of the oral dose absorbed, i.e. the fraction of the dose that enters the

gut lumen.

parameterize_gas_pbtk 267

Fhep.assay.correction

The fraction of chemical unbound in hepatocyte assay using the method of Kil-

ford et al. (2008)

Funbound.plasma

Fraction of chemical unbound to plasma.

Funbound.plasma.adjustment

Fraction unbound to plasma adjusted as described in Pearce et al. 2017

Funbound.plasma.dist

Distribution of fraction unbound to plasma (median, lower 95th, upper 95th)

hematocrit Percent volume of red blood cells in the blood.

Kblood2air Ratio of concentration of chemical in blood to air

Kgut2pu Ratio of concentration of chemical in gut tissue to unbound concentration in

plasma.

kgutabs Rate that chemical enters the gut from gutlumen, 1/h.

Kkidney2pu Ratio of concentration of chemical in kidney tissue to unbound concentration in

plasma.

Kliver2pu Ratio of concentration of chemical in liver tissue to unbound concentration in

plasma.

Klung2pu Ratio of concentration of chemical in lung tissue to unbound concentration in

plasma.

km Michaelis-Menten concentration of half-maximal activity

Kmuc2air Mucus to air partition coefficient

Krbc2pu Ratio of concentration of chemical in red blood cells to unbound concentration

in plasma.

Krest2pu Ratio of concentration of chemical in rest of body tissue to unbound concentra-

tion in plasma.

kUrtc Unscaled upper respiratory tract uptake parameter (L/h/kg^0.75)

liver.density Density of liver in g/mL

MA phospholipid:water distribution coefficient, membrane affinity

million.cells.per.gliver

Millions cells per gram of liver tissue.

MW Molecular Weight, g/mol.

pKa_Accept compound H association equilibrium constant(s)

pKa_Donor compound H dissociation equilibrium constant(s)

Pow octanol:water partition coefficient (not log transformed)

Qalvc Unscaled alveolar ventilation rate (L/h/kg^0.75)

Qcardiacc Cardiac Output, L/h/kg BW^3/4.

Qgfrc Glomerular Filtration Rate, L/h/kg BW^0.75, volume of fluid filtered from kid-

ney and excreted.

Qgutf Fraction of cardiac output flowing to the gut.

Qkidneyf Fraction of cardiac output flowing to the kidneys.

Qliverf Fraction of cardiac output flowing to the liver.
Qlungf Fraction of cardiac output flowing to lung tissue.

Qrestf Fraction of blood flow to rest of body

Rblood2plasma The ratio of the concentration of the chemical in the blood to the concentration

in the plasma from available_rblood2plasma.

Vartc Volume of the arteries per kg body weight, L/kg BW.

Vgutc Volume of the gut per kg body weight, L/kg BW.

Vkidneyc Volume of the kidneys per kg body weight, L/kg BW.

Vliverc Volume of the liver per kg body weight, L/kg BW.

Vlungc Volume of the lungs per kg body weight, L/kg BW.

Vmax Michaelis-Menten maximum reaction velocity (1/min)

Vmucc Unscaled mucosal volume (L/kg BW^0.75

Vrestc Volume of the rest of the body per kg body weight, L/kg BW.

Vvenc Volume of the veins per kg body weight, L/kg BW.

parameterize_IVD

Parameterize In Vitro Distribution Models

Description

This function collects physicochemical properties from chemicals input by the user for use with armitage.R and kramer.R.

Usage

```
parameterize_IVD(tcdata = NA, casrn.vector = NA_character_, this.pH = 7)
```

Arguments

tcdata A data.table with casrn, nomconc, MP, gkow, gkaw, gswat, sarea, v_total, v_working.

Otherwise supply single values to this.params (e.g., this.sarea, this.v_total, etc.).

Chemical parameters are taken from chem.physical_and_invitro.data.

casrn.vector For vector or single value, CAS number

this.pH pH of media

270 parameterize_kramer

Value

| Param | Description | Units |
|------------|---|----------------------|
| casrn | Chemical Abstracts Service Registry Number | character |
| logHenry | The log10 Henry's law constant | atm*m^3/mol |
| gswat | The log10 water solubility at 25C (logWSol) | log10 mol/L |
| MP_C | The chemical compound's melting point | degrees C |
| MW | The chemical compound's molecular weight | g/mol |
| gkow_n | The log10 octanol to water (PC) (logP) | log10 unitless ratio |
| pKa_Donor | Chemical dissociation equilibrium constant(s); pKa(ie pKa_Donor) = -log10(Ka) | unitless |
| pKa_Accept | Chemical association equilibrium constant(s); pKb(ie pKa_Accept) = 14 - pKa | unitless |
| pН | pH where ionization is evaluated (typically assay medium) | unitless |
| gkaw_n | The air to water PC (neutral) | unitless ratio |

Author(s)

Meredith Scherer

Examples

```
library(httk)
output <- parameterize_IVD(casrn.vector = c("15687-27-1"))
print(output)</pre>
```

 $parameterize_kramer \hspace*{0.2cm} \textit{Parameterize Kramer IVD Model} \\$

Description

This function takes inputs from kramer_eval() and calls parameterize_IVD(). Converts units and sets up variables for kramer_eval().

Usage

```
parameterize_kramer(
  tcdata = NA,
  casrn.vector = NA_character_,
  this.FBSf = NA_real_,
  this.BSA = 44,
  this.v_total = NA_real_,
  this.v_working = NA_real_,
  this.cell_yield = NA_real_,
```

parameterize_kramer 271

```
this.sarea = NA_real_,
this.prot_conc = 0.21
)
```

Arguments

| tcdata | A data table with well_number corresponding to plate format, optionally include v_working, sarea, option.bottom, and option.plastic | |
|-----------------|---|--|
| casrn.vector | A deprecated argument specifying a single or vector of Chemical Abstracts Service Registry Number(s) (CAS-RN) of desired chemical(s). | |
| this.FBSf | Fraction fetal bovine serum | |
| this.BSA | bovine serum albumin concentration (g/L) | |
| this.v_total | Total volume per well (uL) | |
| this.v_working | Working volume per well (uL) | |
| this.cell_yield | | |
| | Number of cells/well seeded | |
| this.sarea | Surface area per well (m^2) | |
| this.prot_conc | Cell protein concentration (mg protein/million cells) | |

Value

A data table composed of any input data.table *tcdata* with only the following columns either created or altered by this function:

| Column Name | Description | Units |
|----------------|--------------------------------------|---------|
| sarea | surface area | m^2 |
| v_working_m3 | working (filled) volume of each well | m^3 |
| v_total_m3 | total volume of each well | m^3 |
| v_headspace_m3 | volume of headspace per well | m^3 |
| conc_BSA | BSA concentration in media | kg/L |
| FBSp | Percent fetal bovine serum in media | percent |
| conc_cell_mg | concentration of cell lipids | mg/m^3 |
| conc_cell | concentration of cell lipids | kg/m^3 |
| conc_plastic | concentration of plastic | m2/m^3 |

parameterize_pbtk

Parameters for a generic physiologically-based toxicokinetic model

Description

Generate a chemical- and species-specific set of PBPK model parameters. Parameters include tissue:plasma partition coefficients, organ volumes, and flows for the tissue lumping scheme specified by argument tissuelist. Tissure:(fraction unbound in) plasma partitition coefficients are predicted via Schmitt (2008)'s method as modified by Pearce et al. (2017) using predict_partitioning_schmitt. Organ volumes and flows are retrieved from table physiology.data. Tissues must be described in table tissue.data.

Usage

```
parameterize_pbtk(
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  species = "Human",
  default.to.human = FALSE,
 tissuelist = list(liver = c("liver"), kidney = c("kidney"), lung = c("lung"), gut =
    c("gut")),
  force.human.clint.fup = FALSE,
  clint.pvalue.threshold = 0.05,
  adjusted.Funbound.plasma = TRUE,
  adjusted.Clint = TRUE,
  regression = TRUE,
  suppress.messages = FALSE,
  restrictive.clearance = TRUE,
 minimum.Funbound.plasma = 1e-04,
  class.exclude = TRUE,
  physchem.exclude = TRUE,
 million.cells.per.gliver = 110,
  liver.density = 1.05,
  kgutabs = NA,
  Caco2.options = NULL,
)
```

Arguments

| chem.cas | Chemical Abstract Services Registry Number (CAS-RN) – the chemical must be identified by either CAS, name, or DTXISD |
|-----------|--|
| chem.name | Chemical name (spaces and capitalization ignored) – the chemical must be identified by either CAS, name, or DTXISD |
| dtxsid | EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) – the chemical must be identified by either CAS, name, or DTXSIDs |

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human"). default.to.human

Substitutes missing animal values with human values if true (hepatic intrinsic clearance or fraction of unbound plasma).

Specifies compartment names and tissues groupings. Remaining tissues in tissue.data are lumped in the rest of the body. However, solve_pbtk only works with the default parameters.

force.human.clint.fup

Forces use of human values for hepatic intrinsic clearance and fraction of unbound plasma if true.

clint.pvalue.threshold

Hepatic clearance for chemicals where the in vitro clearance assay result has a p-values greater than the threshold are set to zero.

adjusted.Funbound.plasma

Uses Pearce et al. (2017) lipid binding adjustment for Funbound.plasma (which impacts partition coefficients) when set to TRUE (Default).

adjusted.Clint Uses Kilford et al. (2008) hepatocyte incubation binding adjustment for Clint when set to TRUE (Default).

regression Whether or not to use the regressions in calculating partition coefficients. suppress.messages

Whether or not the output message is suppressed.

restrictive.clearance

In calculating hepatic.bioavailability, protein binding is not taken into account (set to 1) in liver clearance if FALSE.

minimum.Funbound.plasma

 f_{up} is not allowed to drop below this value (default is 0.0001).

class.exclude Exclude chemical classes identified as outside of domain of applicability by relevant modelinfo_[MODEL] file (default TRUE).

physchem.exclude

Exclude chemicals on the basis of physico-chemical properties (currently only Henry's law constant) as specified by the relevant modelinfo_[MODEL] file (default TRUE).

million.cells.per.gliver

Hepatocellularity (defaults to 110 10⁶ cells/g-liver, from Carlile et al. (1997))

liver.density Liver density (defaults to 1.05 g/mL from International Commission on Radiological Protection (1975))

kgutabs Oral absorption rate from gut (determined from Peff)

Caco2.options A list of options to use when working with Caco2 apical to basolateral data

Caco2.Pab, default is Caco2.options = list(Caco2.Pab.default = 1.6, Caco2.Fabs = TRUE, Caco2.Fgut = TRUE, overwrite.invivo = FALSE, keepit100 = FALSE). Caco2.Pab.default sets the default value for Caco2.Pab if Caco2.Pab is unavailable. Caco2.Fabs = TRUE uses Caco2.Pab to calculate fabs.oral, otherwise fabs.oral = Fabs. Caco2.Fgut = TRUE uses Caco2.Pab to calculate fgut.oral, otherwise fgut.oral = Fgut. overwrite.invivo = TRUE overwrites Fabs and Fgut in vivo values from literature with Caco2 derived values if available. keepit100

= TRUE overwrites Fabs and Fgut with 1 (i.e. 100 percent) regardless of other settings. See get_fbio for further details.

... Additional arguments, not currently used.

Details

By default, this function initializes the parameters needed in the functions solve_pbtk, calc_css, and others using the httk default generic PBTK model (for oral and intravenous dosing only).

The default PBTK model includes an explicit first pass of the chemical through the liver before it becomes available to systemic blood. We model systemic oral bioavailability as $F_{bio} = F_{abs} * F_{gut} * F_{hep}$. Only if F_{bio} has been measured in vivo and is found in table chem.physical_and_invitro.data then we set $F_{abs} * F_{gut}$ to the measured value divided by F_{hep} where F_{hep} is estimated from in vitro TK data using calc_hep_bioavailability. If Caco2 membrane permeability data or predictions are available F_{abs} is estimated using calc_fabs.oral. Intrinsic hepatic metabolism is used to very roughly estimate F_{gut} using calc_fgut.oral.

Because this model does not simulate exhalation, inhalation, and other processes relevant to volatile chemicals, this model is by default restricted to chemicals with a logHenry's Law Constant less than that of Acetone, a known volatile chemical. That is, chemicals with logHLC > -4.5 (Log10 atm-m3/mole) are excluded. Volatility is not purely determined by the Henry's Law Constant, therefore this chemical exclusion may be turned off with the argument "physchem.exclude = FALSE". Similarly, per- and polyfluoroalkyl substances (PFAS) are excluded by default because the transporters that often drive PFAS toxicokinetics are not included in this model. However, PFAS chemicals can be included with the argument "class.exclude = FALSE".

Value

BW Body Weight, kg.

Clmetabolismc Hepatic Clearance, L/h/kg BW.

Fabsgut Fraction of the oral dose absorbed, i.e. the fraction of the dose that enters the

gutlumen.

Funbound.plasma

Fraction of plasma that is not bound.

Fhep.assay.correction

The fraction of chemical unbound in hepatocyte assay using the method of Kil-

ford et al. (2008)

hematocrit Percent volume of red blood cells in the blood.

Kgut2pu Ratio of concentration of chemical in gut tissue to unbound concentration in

plasma.

kgutabs Rate that chemical enters the gut from gutlumen, 1/h.

Kkidney2pu Ratio of concentration of chemical in kidney tissue to unbound concentration in

plasma.

Kliver2pu Ratio of concentration of chemical in liver tissue to unbound concentration in

plasma.

Klung2pu Ratio of concentration of chemical in lung tissue to unbound concentration in

plasma.

Krbc2pu Ratio of concentration of chemical in red blood cells to unbound concentration

in plasma.

Krest2pu Ratio of concentration of chemical in rest of body tissue to unbound concentra-

tion in plasma.

million.cells.per.gliver

Millions cells per gram of liver tissue.

MW Molecular Weight, g/mol.

Qcardiacc Cardiac Output, L/h/kg BW^3/4.

Ogfrc Glomerular Filtration Rate, L/h/kg BW^3/4, volume of fluid filtered from kidney

and excreted.

Qgutf Fraction of cardiac output flowing to the gut.

Qkidneyf Fraction of cardiac output flowing to the kidneys.

Qliverf Fraction of cardiac output flowing to the liver.

Rblood2plasma The ratio of the concentration of the chemical in the blood to the concentration

in the plasma from available_rblood2plasma.

Volume of the arteries per kg body weight, L/kg BW.

Vgutc

Volume of the gut per kg body weight, L/kg BW.

Vkidneyc

Volume of the kidneys per kg body weight, L/kg BW.

Vliverc

Volume of the liver per kg body weight, L/kg BW.

Vlungc

Volume of the lungs per kg body weight, L/kg BW.

Vrestc Volume of the rest of the body per kg body weight, L/kg BW.

Vvenc Volume of the veins per kg body weight, L/kg BW.

Examples

parameterize_pfas1comp

Parameters for a one compartment (empirical) toxicokinetic model for PFAS

Description

This function initializes the parameters needed in the function solve_1comp. The toxiokinetic model is of the form of an empirical, single compartment in which all tissues are well mixed. The route of exposure can be oral or intravenous. For oral exposures a hepatic extraction factor (first-pass metabolism) is estimated using chemical-specific *in vitro*-measured intrinsic hepatic clearance and fraction unbound in plasma, if available. If these chemical-specific parameters are not available then all chemical is assumed to be absorbed. The rate of oral absorption used is 2.2 L/h, the median rate observed across 44 chemicals by Wambaugh et al. (2018) (doi:10.1093/toxsci/kfy020). There is a single, unspecified route of elimination (clearance). Half-life is estimated using the Dawson

et al. (2023) (doi:10.3390/toxics11020098) machine learning model for per- and poly-flurinated alkyl substances (PFAS). In keeping with the findings of that paper, volume of distribution is held fixed at 0.205 L kg/BW. Clearance is calculated as the product of elimination rate (determined from half-life) and the volume of distribution. The ratio of chemical concentration in blood to plasma is determined according to Poothong et al. (2017) (doi:10.1021/acs.est.7b03299) where compounds that are ionized at pH 7.4 (plasma) get a value of 0.5, while chemicals that are neutral get a value of 20.

Usage

```
parameterize_pfas1comp(
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  species = "Human",
  sex = "Female",
  dosingadj = "Oral",
  restrict.doa = "ClassModDomain",
  estimate.firstpass = TRUE,
  suppress.messages = FALSE,
  Caco2.options = list(),
  class.exclude = TRUE,
  physchem.exclude = TRUE
)
```

Arguments

| chem.cas | Chemical Abstract Services Registry Number (CAS-RN) – the chemical must be identified by either CAS, name, or DTXISD |
|--------------------|--|
| chem.name | Chemical name (spaces and capitalization ignored) – the chemical must be identified by either CAS, name, or DTXISD |
| dtxsid | EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) – the chemical must be identified by either CAS, name, or DTXSIDs |
| species | Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human"). |
| sex | Sex of simulated individual ("Male" or "Female") |
| dosingadj | Route of dosing for Dawson et al. (2023) PFAS half-life model ("oral", "iv", or "other") |
| restrict.doa | Whether to restrict to chemicals within an estimated domain of applicability based on the properties of the training set ("ClassModDomain"), the domain of all models ("AMAD"), or none ("none") (Defaults to "ClassModDomain"). |
| estimate.firstpass | |
| | Whether to estimate first-pass hepatic metabolism, which can only be done for |

a subset of PFAS with in vitro HTTK parameters (Defaults to TRUE). suppress.messages

Whether to suppress messages (Defaults to FALSE).

Caco2.options

A list of options to use when working with Caco2 apical to basolateral data Caco2.Pab, default is Caco2.options = list(Caco2.Pab.default = 1.6, Caco2.Fabs = TRUE, Caco2.Fgut = TRUE, overwrite.invivo = FALSE, keepit100 = FALSE). Caco2.Pab.default sets the default value for Caco2.Pab if Caco2.Pab is unavailable. Caco2.Fabs = TRUE uses Caco2.Pab to calculate fabs.oral, otherwise fabs.oral = Fabs. Caco2.Fgut = TRUE uses Caco2.Pab to calculate fgut.oral, otherwise fgut.oral = Fgut. overwrite.invivo = TRUE overwrites Fabs and Fgut in vivo values from literature with Caco2 derived values if available. keepit100 = TRUE overwrites Fabs and Fgut with 1 (i.e. 100 percent) regardless of other settings. See get_fbio for further details.

class.exclude

Exclude chemical classes identified as outside of domain of applicability by relevant modelinfo_[MODEL] file (default TRUE).

physchem.exclude

Exclude chemicals on the basis of physico-chemical properties (currently only Henry's law constant) as specified by the relevant modelinfo_[MODEL] file (default TRUE).

Value

Volume of distribution, units of L/kg BW.

plasma.vol Volume of the plasma, L/kg BW.

Fabsgut Fraction of the oral dose absorbed, that is, the fraction of the dose that enters the

gutlumen.

Fhep.assay.correction

Not used for this model

kelim Elimination rate, units of 1/h.

hematocrit Percent volume of red blood cells in the blood.

kgutabs Rate chemical is absorbed, 1/h.

million.cells.per.gliver

Not used for this model

MW Molecular Weight, g/mol.

Rblood2plasma The ratio of the concentration of the chemical in the blood to the concentration

in the plasma. Not used in calculations but included for the conversion of plasma

outputs.

hepatic.bioavailability

Fraction of dose remaining after first pass clearance, calculated from the cor-

rected well-stirred model.

BW Body Weight, kg.

pKa_Donor Ionization equilibria (if any) for hydrogen donation (acids).
pKa_Accept Ionization equilibria (if any) for hydrogen acceptance (bases).

parameterize_schmitt Parameters for Schmitt's (2008) Tissue Partition Coefficient Method

Description

This function provides the necessary parameters to run predict_partitioning_schmitt, excluding the data in table tissue.data. The model is based on the Schmitt (2008) (doi:10.1016/j.tiv.2007.09.010) method for predicting tissue:plasma partition coefficients as modified by Pearce et al. (2017) (doi:10.1007/s1092801795487). The modifications include approaches adapted from Peyret et al. (2010) (doi:10.1016/j.taap.2010.09.010).

280 parameterize_schmitt

Usage

```
parameterize_schmitt(
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  parameters = NULL,
  species = "Human",
  default.to.human = FALSE,
  force.human.fup = FALSE,
  adjusted.Funbound.plasma = TRUE,
  suppress.messages = FALSE,
  class.exclude = TRUE,
  minimum.Funbound.plasma = 1e-04,
  pfas.calibration = TRUE
)
```

Arguments

chem.cas Chemical Abstract Services Registry Number (CAS-RN) – if parameters is not

specified then the chemical must be identified by either CAS, name, or DTXISD

chem.name Chemical name (spaces and capitalization ignored) – if parameters is not speci-

fied then the chemical must be identified by either CAS, name, or DTXISD

dtxsid EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) – if pa-

rameters is not specified then the chemical must be identified by either CAS,

name, or DTXSIDs

parameters Chemcial and physiological description parameters needed to run the Schmitt et

al. (2008) model

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

default.to.human

Substitutes missing fraction of unbound plasma with human values if true.

force.human.fup

Returns human fraction of unbound plasma in calculation for rats if true. When species is specified as rabbit, dog, or mouse, the human unbound fraction is substituted.

adjusted.Funbound.plasma

Uses Pearce et al. (2017) lipid binding adjustment for Funbound.plasma (which impacts partition coefficients) when set to TRUE (Default).

suppress.messages

Whether or not the output message is suppressed.

class.exclude Exclude chemical classes identified as outside of domain of applicability by relevant modelinfo_[MODEL] file (default TRUE).

minimum.Funbound.plasma

Monte Carlo draws less than this value are set equal to this value (default is 0.0001 – half the lowest measured Fup in our dataset).

pfas.calibration

Whether MA for chemicals in class PFAS should be increased using the regression to the Droge (2019) dataset.

parameterize_schmitt 281

Value

Funbound.plasma

Unbound fraction in plasma, adjusted for lipid binding according to Pearce et

al. (2017)

unadjusted.Funbound.plasma

measured unbound fraction in plasma (0.005 if below limit of detection)

Pow octanol:water partition coefficient (not log transformed)

pKa_Donor compound H dissociation equilibrium constant(s)
pKa_Accept compound H association equilibrium constant(s)

MA phospholipid:water distribution coefficient, membrane affinity

Fprotein.plasma

protein fraction in plasma

plasma.pH pH of the plasma

parameterize_steadystate

Parameters for a three-compartment toxicokinetic model at steadystate

Description

This function initializes the parameters needed in the functions calc_mc_css, calc_mc_oral_equiv, and calc_analytic_css for the three compartment steady state model ('3compartmentss') as used in Rotroff et al. (2010), Wetmore et al. (2012), Wetmore et al. (2015), and elsewhere. By assuming that enough time has passed to reach steady-state, we eliminate the need for tissue-specific parititon coefficients because we assume all tissues have come to equilibrium with the unbound concentration in plasma. However, we still use chemical properties to predict the blood:plasma ratio for estimating first-pass hepatic metabolism for oral exposures.

Usage

```
parameterize_steadystate(
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  species = "Human",
  clint.pvalue.threshold = 0.05,
  default.to.human = FALSE,
  class.exclude = TRUE,
  physchem.exclude = TRUE,
  force.human.clint.fup = FALSE,
  adjusted.Funbound.plasma = TRUE,
  adjusted.Clint = TRUE,
  restrictive.clearance = TRUE,
  fup.lod.default = 0.005,
  suppress.messages = FALSE,
```

```
minimum.Funbound.plasma = 1e-04,
  Caco2.options = NULL,
   ...
)
```

Arguments

chem.cas Chemical Abstract Services Registry Number (CAS-RN) – the chemical must

be identified by either CAS, name, or DTXISD

chem. name Chemical name (spaces and capitalization ignored) – the chemical must be iden-

tified by either CAS, name, or DTXISD

dtxsid EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) - the

chemical must be identified by either CAS, name, or DTXSIDs

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

clint.pvalue.threshold

Hepatic clearances with clearance assays having p-values greater than the threshold are set to zero.

default.to.human

Substitutes missing species-specific values with human values if TRUE (default is FALSE).

class.exclude Exclude chemical classes identified as outside of domain of applicability by relevant modelinfo_[MODEL] file (default TRUE).

physchem.exclude

Exclude chemicals on the basis of physico-chemical properties (currently only Henry's law constant) as specified by the relevant modelinfo_[MODEL] file (default TRUE).

force.human.clint.fup

Uses human hepatic intrinsic clearance and fraction of unbound plasma in calculation of partition coefficients for rats if true.

adjusted.Funbound.plasma

Uses Pearce et al. (2017) lipid binding adjustment for Funbound.plasma (which impacts partition coefficients) when set to TRUE (Default).

adjusted.Clint Uses Kilford et al. (2008) hepatocyte incubation binding adjustment for Clint when set to TRUE (Default).

restrictive.clearance

In calculating hepatic.bioavailability, protein binding is not taken into account (set to 1) in liver clearance if FALSE.

fup.lod.default

Default value used for fraction of unbound plasma for chemicals where measured value was below the limit of detection. Default value is 0.0005.

suppress.messages

Whether or not the output message is suppressed.

minimum.Funbound.plasma

Monte Carlo draws less than this value are set equal to this value (default is 0.0001 – half the lowest measured Fup in our dataset).

Caco2.options A list of options to

A list of options to use when working with Caco2 apical to basolateral data Caco2.Pab, default is Caco2.options = list(Caco2.Pab.default = 1.6, Caco2.Fabs = TRUE, Caco2.Fgut = TRUE, overwrite.invivo = FALSE, keepit100 = FALSE). Caco2.Pab.default sets the default value for Caco2.Pab if Caco2.Pab is unavailable. Caco2.Fabs = TRUE uses Caco2.Pab to calculate fabs.oral, otherwise fabs.oral = Fabs. Caco2.Fgut = TRUE uses Caco2.Pab to calculate fgut.oral, otherwise fgut.oral = Fgut. overwrite.invivo = TRUE overwrites Fabs and Fgut in vivo values from literature with Caco2 derived values if available. keepit100 = TRUE overwrites Fabs and Fgut with 1 (i.e. 100 percent) regardless of other settings. See get_fbio for further details.

.. Other parameters

Details

We model systemic oral bioavailability as $F_{bio} = F_{abs} * F_{gut} * F_{hep}$. F_{hep} is estimated from in vitro TK data using calc_hep_bioavailability. If F_{bio} has been measured in vivo and is found in table chem.physical_and_invitro.data then we set $F_{abs} * F_{git}$ to the measured value divided by F_{hep} Otherwise, if Caco2 membrane permeability data or predictions are available F_{abs} is estimated using calc_fabs.oral. Intrinsic hepatic metabolism is used to very roughly estimate F_{gut} using calc_fgut.oral.

Because this model does not simulate exhalation, inhalation, and other processes relevant to volatile chemicals, this model is by default restricted to chemicals with a logHenry's Law Constant less than that of Acetone, a known volatile chemical. That is, chemicals with logHLC > -4.5 (Log10 atm-m3/mole) are excluded. Volatility is not purely determined by the Henry's Law Constant, therefore this chemical exclusion may be turned off with the argument "physchem.exclude = FALSE". Similarly, per- and polyfluoroalkyl substances (PFAS) are excluded by default because the transporters that often drive PFAS toxicokinetics are not included in this model. However, PFAS chemicals can be included with the argument "class.exclude = FALSE".

Value

Clint Hepatic Intrinsic Clearance, uL/min/10⁶ cells.

Fabsgut Fraction of the oral dose absorbed and surviving gut metabolism, that is, the

fraction of the dose that enters the gutlumen.

Funbound.plasma

Fraction of plasma that is not bound.

Qtotal.liverc Flow rate of blood exiting the liver, L/h/kg BW^3/4.

Qgfrc Glomerular Filtration Rate, L/h/kg BW^3/4, volume of fluid filtered from kidney

and excreted.

BW Body Weight, kg

MW Molecular Weight, g/mol

million.cells.per.gliver

Millions cells per gram of liver tissue.

Vliverc Volume of the liver per kg body weight, L/kg BW.

liver.density Liver tissue density, kg/L.

Fhep.assay.correction

The fraction of chemical unbound in hepatocyte assay using the method of Kilford et al. (2008)

hepatic.bioavailability

Fraction of dose remaining after first pass clearance, calculated from the corrected well-stirred model.

parameterize_sumclearancespfas

Parameters for a three-compartment model at steady-state with exhalation and resorption

Description

This function initializes the parameters needed in the functions calc_mc_css, calc_mc_oral_equiv, and calc_analytic_css for the PFAS-aware version of the sum of clearances model ("sumclearancespfas"). The model is described in Wambaugh et al. (in preparation). For PFAS compounds the effectiveness of glomerular filtration in the kidneys is set according to the half-life predicted by the Dawson et al. (2023) model. By assuming that enough time has passed to reach steady-state, we eliminate the need for tissue-specific partition coefficients because we assume all tissues have come to equilibrium with the unbound concentration in plasma. However, we still use chemical properties to predict the blood:plasma ratio for estimating first-pass hepatic metabolism for oral exposures.

Usage

```
parameterize_sumclearancespfas(
  chem.cas = NULL,
  chem.name = NULL,
  dtxsid = NULL,
  species = "Human",
  sex = "Female",
  dosingadj = "Oral",
  restrict.doa = "ClassModDomain",
  clint.pvalue.threshold = 0.05,
  default.to.human = FALSE,
  class.exclude = TRUE,
  physchem.exclude = TRUE,
  force.human.clint.fup = FALSE,
  adjusted.Funbound.plasma = TRUE,
  adjusted.Clint = TRUE,
  restrictive.clearance = TRUE,
  fup.lod.default = 0.005,
  suppress.messages = FALSE,
  minimum.Funbound.plasma = 1e-04,
  Caco2.options = NULL
)
```

Arguments

| chem.cas | Chemical Abstract Services Registry Number (CAS-RN) – the chemical must be identified by either CAS, name, or DTXISD |
|-----------|---|
| chem.name | Chemical name (spaces and capitalization ignored) – the chemical must be identified by either CAS, name, or DTXISD |
| dtxsid | EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) – the chemical must be identified by either CAS, name, or DTXSIDs |
| species | Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human"). |
| sex | Sex of simulated individual ("Male" or "Female") |
| dosingadj | Route of dosing for Dawson et al. (2023) PFAS half-life model ("oral", "iv", or "other") |

restrict.doa Whether to restrict to chemicals within an estimated domain of applicability based on the properties of the training set ("ClassModDomain"), the domain of all models ("AMAD"), or none ("none") (Defaults to "ClassModDomain").

clint.pvalue.threshold

Hepatic clearances with clearance assays having p-values greater than the threshold are set to zero.

default.to.human

Substitutes missing species-specific values with human values if TRUE (default is FALSE).

class.exclude Exclude chemical classes identified as outside of domain of applicability by relevant modelinfo [MODEL] file (default TRUE).

physchem.exclude

Exclude chemicals on the basis of physico-chemical properties (currently only Henry's law constant) as specified by the relevant modelinfo_[MODEL] file (default TRUE).

force.human.clint.fup

Uses human hepatic intrinsic clearance and fraction of unbound plasma in calculation of partition coefficients for rats if true.

adjusted.Funbound.plasma

Uses Pearce et al. (2017) lipid binding adjustment for Funbound.plasma (which impacts partition coefficients) when set to TRUE (Default).

adjusted.Clint Uses Kilford et al. (2008) hepatocyte incubation binding adjustment for Clint when set to TRUE (Default).

restrictive.clearance

In calculating hepatic.bioavailability, protein binding is not taken into account (set to 1) in liver clearance if FALSE.

fup.lod.default

Default value used for fraction of unbound plasma for chemicals where measured value was below the limit of detection. Default value is 0.0005.

suppress.messages

Whether or not the output message is suppressed.

minimum.Funbound.plasma

Monte Carlo draws less than this value are set equal to this value (default is 0.0001 – half the lowest measured Fup in our dataset).

Caco2.options

A list of options to use when working with Caco2 apical to basolateral data Caco2.Pab, default is Caco2.options = list(Caco2.Pab.default = 1.6, Caco2.Fabs = TRUE, Caco2.Fgut = TRUE, overwrite.invivo = FALSE, keepit100 = FALSE). Caco2.Pab.default sets the default value for Caco2.Pab if Caco2.Pab is unavailable. Caco2.Fabs = TRUE uses Caco2.Pab to calculate fabs.oral, otherwise fabs.oral = Fabs. Caco2.Fgut = TRUE uses Caco2.Pab to calculate fgut.oral, otherwise fgut.oral = Fgut. overwrite.invivo = TRUE overwrites Fabs and Fgut in vivo values from literature with Caco2 derived values if available. keepit100 = TRUE overwrites Fabs and Fgut with 1 (i.e. 100 percent) regardless of other settings. See get_fbio for further details.

Details

We model systemic oral bioavailability as $F_{bio} = F_{abs} * F_{gut} * F_{hep}$. F_{hep} is estimated from in vitro TK data using calc_hep_bioavailability. If F_{bio} has been measured in vivo and is found in table chem.physical_and_invitro.data then we set $F_{abs} * F_{git}$ to the measured value divided by F_{hep} Otherwise, if Caco2 membrane permeability data or predictions are available F_{abs} is estimated using calc_fabs.oral. Intrinsic hepatic metabolism is used to very roughly estimate F_{qut} using calc_fgut.oral.

Value

Clint Hepatic Intrinsic Clearance, uL/min/10⁶ cells.

Fabsgut Fraction of the oral dose absorbed, i.e. the fraction of the dose that enters the

gutlumen.

Funbound.plasma

Fraction of plasma that is not bound.

Qtotal.liverc Flow rate of blood exiting the liver, L/h/kg BW^3/4.

Qgfrc Glomerular Filtration Rate, L/h/kg BW^3/4, volume of fluid filtered from kidney

and excreted.

BW Body Weight, kg

MW Molecular Weight, g/mol

million.cells.per.gliver

Millions cells per gram of liver tissue.

Vliverc Volume of the liver per kg body weight, L/kg BW.

liver.density Liver tissue density, kg/L.

Fhep.assay.correction

The fraction of chemical unbound in hepatocyte assay using the method of Kil-

ford et al. (2008)

hepatic.bioavailability

Fraction of dose remaining after first pass clearance, calculated from the cor-

rected well-stirred model.

Interspecies In vivo Clearance Data for PFAS

Description

If the chemical- and species-specific TK half-life $(t_{1/2})$ and volume of distribution (V_d) are known, a whole-body plasma clearance rate can be calculated as:

$$Cl_{tot} = ln(1/2)/t_{1/2} * V_d$$

The first term involving the natural logarithm of 1/2 converts half-life (h) into an elimination rate (1/h) so that Cl_{tot} has units of L/kg bodyweight/h. Dawson et al. (2023) reported a table of in vivo PFAS $t_{1/2}$ data for multiple species across eleven PFAS. Most of the measured data are for rodents. These data result from a series of reviews of the literature by Lau et al. (most recently Fenton et al. 2021) that were further revised for Dawson et al. (2023). Dawson et al. (2023) Supplemental Information S2.5 compiled V_d values that were used here for calculating total clearance. A dataset of literature-derived values of V_d was compiled starting from Pizzurro et al. (2019) Table 2, which compiled 38 observations spanning five PFAS chemicals, four species, and both sexes from various literature sources. To these we added 24 calculated V_d observations in rat for three chemicals across a range of doses and routes from Huang et al. (2019). Further values for V_d were collected from the peer-review literature (Dzierlenga et al. 2020; Lau et al. 2020; Lou et al. 2009; Tatum-Gibbs et al. 2011). The total data set includes 128 values for V_d from 8 PFAS chemicals across 4 species. A Cl_{tot} was calculated using the above equation for every chemical- and species-specific half-life reported in the Dawson et al. (2023) supplemental materials. For chemicals without species- and compound-specific measurements for V_d we used the median in vivo measured PFAS Vd of 0.205 L/kg BW.

physiology.data

Species-specific physiology parameters

Description

This data set contains values from Davies and Morris (1993) necessary to paramaterize a toxicokinetic model for human, mouse, rat, dog, or rabbit. The temperature for each species are taken from Reece (2015), Jordon (1995), and Stammers (1926). Mean residence time for the small intestine is from Grandoni et al. (2019). Human small intestine radius is from Yu et al. (1999). Rat small intestine radius is from Griffin and O'Driscoll (2008).

predict_partitioning_schmitt

Predict partition coefficients using the method from Schmitt (2008).

Description

This function implements the method from Schmitt (2008) for predicting the tissue to unbound plasma partition coefficients for the tissues contained in the tissue.data table. The method has been modified by Pearce et al. (2017) based on an evaluation using in vivo measured partition coefficients.

To understand this method, it is important to recognize that in a given media the fraction unbound in that media is inverse of the media:water partition coefficient. In Schmitt's model, each tissue

is composed of cells and interstitium, with each cell consisting of neutral lipid, neutral phospholipid, water, protein, and acidic phospholipid. Each tissue cell is defined as the sum of separate compartments for each constituent, all of which partition with a shared water compartment. The partitioning between the cell components and cell water is compound specific and determined by log Pow (in neutral lipid partitioning), membrane affinity (phospholipid and protein partitioning), and pKa (neutral lipid and acidic phospholipid partitioning). For a given compound the partitioning into each component is identical across tissues. Thus the differences among tissues are driven by their composition, that is, the varying volumes of components such as neutral lipid. However, pH differences across tissues also determine small differences in partitioning between cell and plasma water. The fup is used as the plasma water to total plasma partition coefficient and to approximate the partitioning between interstitial protein and water.

A regression is used to predict membrane affinity when measured values are not available (calc_ma). The regressions for correcting each tissue are performed on tissue plasma partition coefficients (Ktissue2pu * Funbound.plasma) calculated with the corrected Funbound.plasma value and divided by this value to get Ktissue2pu. Thus the regressions should be used with the corrected Funbound.plasma.

A separate regression is used when adjusted. Funbound. plasma is FALSE.

The red blood cell regression can be used but is not by default because of the span of the data used for evaluation, reducing confidence in the regression for higher and lower predicted values.

Human tissue volumes are used for species other than Rat.

Usage

```
predict_partitioning_schmitt(
  chem.name = NULL,
  chem.cas = NULL,
  dtxsid = NULL,
  species = "Human",
 model = "pbtk",
  default.to.human = FALSE,
  parameters = NULL,
  alpha = 0.001,
  adjusted.Funbound.plasma = TRUE,
  regression = TRUE,
 regression.list = c("brain", "adipose", "gut", "heart", "kidney", "liver", "lung",
    "muscle", "skin", "spleen", "bone"),
  tissues = NULL,
 minimum.Funbound.plasma = 1e-04,
  suppress.messages = FALSE
)
```

Arguments

chem. name Either the chemical name or the CAS number must be specified.

chem. cas Either the chemical name or the CAS number must be specified.

dtxsid EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chemical must be identified by either CAS, name, or DTXSIDs

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

model Model for which partition coefficients are needed (for example, "pbtk", "3com-

partment")

default.to.human

Substitutes missing animal values with human values if true (hepatic intrinsic

clearance or fraction of unbound plasma).

parameters Chemical parameters from parameterize_schmitt overrides chem.name, dtxsid,

and chem.cas.

alpha Ratio of Distribution coefficient D of totally charged species and that of the

neutral form

adjusted.Funbound.plasma

Whether or not to use Funbound.plasma adjustment.

regression Whether or not to use the regressions. Regressions are used by default.

regression.list

Tissues to use regressions on.

tissues Vector of desired partition coefficients. Returns all by default.

minimum.Funbound.plasma

Monte Carlo draws less than this value are set equal to this value (default is

0.0001 – half the lowest measured Fup in our dataset).

suppress.messages

Whether or not the output message is suppressed.

Value

Returns tissue to unbound plasma partition coefficients for each tissue.

reset_httk

Reset HTTK to Default Data Tables

Description

This function returns an updated version of chem.physical_and_invitro.data that includes data predicted with Simulations Plus' ADMET predictor that was used in Sipes et al. 2017, included in admet.data.

Usage

```
reset_httk(target.env = .GlobalEnv)
```

Arguments

target.env

The environment where the new chem.physical_and_invitro.data is loaded. Defaults to global environment.

Value

data.frame

The package default version of chem.physical_and_invitro.data.

Author(s)

John Wambaugh

Examples

```

rmed@non@u95

Draw random numbers with LOD median but non-zero upper 95th percentile

Description

This function draws N random numbers from a distribution that approximates a median that is equal to the limit of detection (LOD, value x.LOD) but has an upper 95th percentile (x.u95) that is above x.LOD. We make the assumption that values above x.u95 are uniformly distributed between x.u95 and x.u95 + (x.u95 - x.LOD)

Usage

```
rmed0non0u95(n, x.u95, x.min = 0, x.LOD = 0.005)
```

308 r_left_censored_norm

Arguments

| n | Number of samples to draw |
|-------|---|
| x.u95 | The upper limit on the 95th confidence/credible intervale (this is the 97.5 percentile) |
| x.min | The minimum allowed value (defaults to 0) |
| x.LOD | The limit of detection (defaults to 0.005) |

Value

A vector of N samples where the 50th and 97.5th quantiles approximate x.LOD and x.u95 respectively

Author(s)

John Wambaugh

set.seed(1235)
Fup.vec <- rmed0non0u95(n=N, x.u95=Fup.95)
quantile(Fup.vec,c(0.5,0.975))

quantile(rmed0non0u95(200,x.u95=0.05,x.min=10^-4,x.LOD=0.01),c(0.5,0.975))
hist(rmed0non0u95(1000,x.u95=0.005,x.min=10^-4,x.LOD=0.01))

quantile(rmed0non0u95(200,x.u95=0.005,x.min=10^-4,x.LOD=0.01),c(0.5,0.975))
hist(rmed0non0u95(1000,x.u95=0.005,x.min=10^-4,x.LOD=0.01))</pre>
```

 ${\tt r_left_censored_norm} \quad \textit{Returns draws from a normal distribution with a lower censoring limit} \\ of lod (limit of detection)$

Description

Returns draws from a normal distribution with a lower censoring limit of lod (limit of detection)

scale_dosing 309

Usage

```
r_{eq} = 1, r_{eq} = 1,
```

Arguments

| n | Number of samples to take | |
|---|---------------------------|--|
| | | |

mean Mean of censored distribution. Default 0.

sd Standard deviation of censored distribution. Default 1.

Bound below which to censor. Default 0.005.
 Lower bound on censored distribution. Default 0.
 Upper bound on censored distribution. Default 1.

Value

A vector of samples from the specified censored distribution.

scale_dosing

Scale mg/kg body weight doses according to body weight and units

Description

This function transforms the dose (in mg/kg) into the appropriate units. It handles single doses, matrices of doses, or daily repeated doses at varying intervals. Gut absorption is also factored in through the parameter Fabsgut, and scaling is currently avoided in the inhalation exposure case with a scale factor of 1

Usage

```
scale_dosing(
  dosing,
  parameters,
  route,
  input.units = NULL,
  output.units = "uM",
  vol = NULL,
  state = "liquid"
)
```

Arguments

dosing

List of dosing metrics used in simulation, which must include the general entries with names "initial.dose", "doses.per.day", "daily.dose", and "dosing.matrix". The "dosing.matrix" is used for more precise dose regimen specification, and is a matrix consisting of two columns or rows named "time" and "dose" containing the time and amount, in mg/kg BW, of each dose. The minimal usage case involves all entries but "initial.dose" set to NULL in value.

310 Scherer2025.IVD

parameters Chemical parameters from parameterize_pbtk function, overrides chem.name

and chem.cas.

route String specification of route of exposure for simulation: "oral", "iv", "inhala-

tion", ...

input.units Units of the dose values being scaled. (Default is NULL.) Currently supported

units "mg/L", "ug/L", "ug/mL", "uM", "umol/L", "ug/dL", "ug/g", "nmol/L",

"nM", and "ppmw" (supported input.units subject to change).

output.units Desired units (either "mg/L", "mg", "umol", or default "uM").

vol Volume for the target tissue of interest. NOTE: Volume should not be in units of

per BW, i.e. "kg".

state Chemical state of matter (gas or default liquid).

Value

A list of numeric values for doses converted to output.units, potentially (depending on argument dosing) including:

initial.dose The first dose given

dosing.matrix A 2xN matrix where the first column is dose time and the second is dose amount

for N doses

daily.dose The total cumulative daily dose

scr_h

KDE bandwidths for residual variability in serum creatinine

Description

Bandwidths used for a one-dimensional kernel density estimation of the distribution of residual errors around smoothing spline fits of serum creatinine vs. age for NHANES respondents in each of ten combinations of sex and race/ethnicity categories.

Usage

scr_h

Format

A named list with 10 elements, each a numeric value. Each list element corresponds to, and is named for, one combination of NHANES sex categories (Male and Female) and NHANES race/ethnicity categories (Mexican American, Other Hispanic, Non-Hispanic White, Non-Hispanic Black, and Other).

Details

Each matrix is the standard deviation for a normal distribution: this is the bandwidth to be used for a kernel density estimation (KDE) (using a normal kernel) of the distribution of residual errors around smoothing spline fits of serum creatinine vs. age for NHANES respondents in the specified sex and race/ethnicity category. Optimal bandwidths were pre-calculated by doing the smoothing spline fits, getting the residuals, then calling kde on the residuals (which calls hpi to compute the plug-in bandwidth).

Used by HTTK-Pop only in "virtual individuals" mode (i.e. httkpop_generate with method = "v"), in gen_serum_creatinine.

| set_httk_precision | set_httk_precision | |
|--------------------|--------------------|--|
|--------------------|--------------------|--|

Description

Although the ODE solver and other functions return very precise numbers, we cannot (or at least do not spend enough computing time to) be sure of the precioion to an arbitrary level. This function both limits the number of signficant figures reported and truncates the numerical precision.

Usage

```
set_httk_precision(in.num, sig.fig = 4, num.prec = 9)
```

Arguments

in.num The numeric variable (or assembly of numerics) to be processed.

sig.fig The number of significant figures reported. Defaults to 4.

num.prec The precision maintained, digits below 10\(^{\text{num.prec}}\) are dropped. Defaults to 9.

Value

numeric values

skeletal_muscle_mass Predict skeletal muscle mass

Description

Predict skeletal muscle mass from age, height, and gender.

Usage

```
skeletal_muscle_mass(smm, age_years, height, gender)
```

Arguments

smm Vector of allometrically-scaled skeletal muscle masses.

age_years Vector of ages in years. height Vector of heights in cm.

gender Vector of genders, either 'Male' or 'Female.'

Details

For individuals over age 18, use allometrically-scaled muscle mass with an age-based scaling factor, to account for loss of muscle mass with age (Janssen et al. 2000). For individuals under age 18, use skeletal_muscle_mass_children.

Value

Vector of skeletal muscle masses in kg.

Author(s)

Caroline Ring

solve_1comp

Solve one compartment TK model

Description

This function solves for the amount or concentration of a chemical in plasma for a one compartment model as a function of time based on the dose and dosing frequency. The model describes blood concentrations in a single compartment. The volume of distribution depends on the physical volume of each tissue and the predicted chemical partitioning into those volumes. Plasma concentration in compartment x is given by $C_{plasma} = \frac{C_{bland}}{R_{b2p}}$ for a tissue independent value of R_{b2p} .

Usage

```
solve_1comp(
  chem.name = NULL,
  chem.cas = NULL,
  dtxsid = NULL,
  times = NULL,
  parameters = NULL,
  days = 10,
  tsteps = 4,
  daily.dose = NULL,
  dose = NULL,
 doses.per.day = NULL,
  initial.values = NULL,
 plots = FALSE,
  suppress.messages = FALSE,
  species = "Human",
  iv.dose = FALSE,
  input.units = "mg/kg",
  output.units = NULL,
  default.to.human = FALSE,
  class.exclude = TRUE,
  physchem.exclude = TRUE,
  recalc.blood2plasma = FALSE,
  recalc.clearance = FALSE,
  dosing.matrix = NULL,
  adjusted.Funbound.plasma = TRUE,
  regression = TRUE,
 restrictive.clearance = TRUE,
 minimum.Funbound.plasma = 1e-04,
 monitor.vars = NULL,
 Caco2.options = list(),
)
```

Arguments

| chem.name | Either the chemical name, CAS number, or the parameters must be specified. |
|------------|--|
| chem.cas | Either the chemical name, CAS number, or the parameters must be specified. |
| dtxsid | EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chemical must be identified by either CAS, name, or DTXSIDs |
| times | Optional time sequence for specified number of days. |
| parameters | Chemical parameters from parameterize_1comp function, overrides chem.name and chem.cas. |
| days | Length of the simulation. |
| tsteps | The number time steps per hour. |
| daily.dose | Total daily dose, default is mg/kg BW. |

dose Amount of a single dose, default is mg/kg BW.

Number of doses per day. doses.per.day

initial.values Vector containing the initial concentrations or amounts of the chemical in spec-

ified tissues with units corresponding to output.units. Defaults are zero.

plots Plots all outputs if true.

suppress.messages

Whether or not the output message is suppressed.

Species desired (either "Rat", "Rabbit", "Dog", or default "Human"). species

iv.dose Simulates a single i.v. dose if true.

Input units of interest assigned to dosing, defaults to "mg/kg" BW. input.units

A named vector of output units expected for the model results. Default, NULL, output.units

returns model results in units specified in the 'modelinfo' file. See table below

for details.

default.to.human

Substitutes missing rat values with human values if true.

class.exclude Exclude chemical classes identified as outside of domain of applicability by

relevant modelinfo_[MODEL] file (default TRUE).

physchem.exclude

Exclude chemicals on the basis of physico-chemical properties (currently only Henry's law constant) as specified by the relevant modelinfo_[MODEL] file (default TRUE).

recalc.blood2plasma

Whether or not to recalculate the blood:plasma chemical concentration ratio

recalc.clearance

Whether or not to recalculate the elimination rate.

Vector of dosing times or a matrix consisting of two columns or rows named dosing.matrix

"dose" and "time" containing the time and amount, in mg/kg BW by default, of

each dose.

adjusted.Funbound.plasma

Uses adjusted Funbound.plasma when set to TRUE along with volume of distribution calculated with this value.

regression Whether or not to use the regressions in calculating partition coefficients in vol-

ume of distribution calculation.

restrictive.clearance

In calculating elimination rate, protein binding is not taken into account (set to 1) in liver clearance if FALSE.

minimum.Funbound.plasma

Monte Carlo draws less than this value are set equal to this value (default is 0.0001 – half the lowest measured Fup in our dataset).

monitor.vars Which variables are returned as a function of time. Defaults value of NULL

provides "Agutlumen", "Ccompartment", "Ametabolized", "AUC"

Caco2.options A list of options to use when working with Caco2 apical to basolateral data

Caco2. Pab, default is Caco2. options = list(Caco2. Pab. default = 1.6, Caco2. Fabs

= TRUE, Caco2.Fgut = TRUE, overwrite.invivo = FALSE, keepit100 = FALSE).

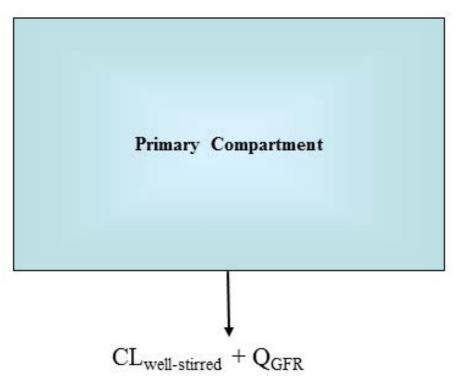

Caco2.Pab.default sets the default value for Caco2.Pab if Caco2.Pab is unavailable. Caco2.Fabs = TRUE uses Caco2.Pab to calculate fabs.oral, otherwise fabs.oral = Fabs. Caco2.Fgut = TRUE uses Caco2.Pab to calculate fgut.oral, otherwise fgut.oral = Fgut. overwrite.invivo = TRUE overwrites Fabs and Fgut in vivo values from literature with Caco2 derived values if available. keepit100 = TRUE overwrites Fabs and Fgut with 1 (i.e. 100 percent) regardless of other settings. See get_fbio for further details.

. . Additional arguments passed to the integrator (deSolve).

Details

Model Figure

altalt Note that the timescales for the model parameters have units of hours while the model output is in days.

Default value of NULL for doses.per.day solves for a single dose.

When species is specified as rabbit, dog, or mouse, the function uses the appropriate physiological data(volumes and flows) but substitutes human fraction unbound, partition coefficients, and intrinsic hepatic clearance.

Because this model does not simulate exhalation, inhalation, and other processes relevant to volatile chemicals, this model is by default restricted to chemicals with a logHenry's Law Constant less than that of Acetone, a known volatile chemical. That is, chemicals with logHLC > -4.5 (Log10 atm-m3/mole) are excluded. Volatility is not purely determined by the Henry's Law Constant, therefore

this chemical exclusion may be turned off with the argument "physchem.exclude = FALSE". Similarly, per- and polyfluoroalkyl substances (PFAS) are excluded by default because the transporters that often drive PFAS toxicokinetics are not included in this model. However, PFAS chemicals can be included with the argument "class.exclude = FALSE".

Value

A matrix with a column for time(in days) and a column for the compartment and the area under the curve (concentration only).

  time.varying.params = TRUE,
```

```
start.age = 360,
  ref.pop.dt = NULL,
 httkpop.generate.arg.list = list(method = "virtual individuals", nsamp = 25000),
  ref.params = NULL,
)
```

Arguments

chem.name Either the chemical name, CAS number, or the parameters must be specified. chem.cas Either the chemical name, CAS number, or the parameters must be specified. dtxsid

EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chem-

ical must be identified by either CAS, name, or DTXSIDs

times Optional time sequence for specified number of days.

Chemical parameters from parameterize_1comp function, overrides chem.name parameters

and chem.cas.

days Length of the simulation.

The number time steps per hour. tsteps Total daily dose, mg/kg BW. daily.dose

dose Amount of a single dose, mg/kg BW.

doses.per.day Number of doses per day.

initial.values Vector containing the initial concentrations or amounts of the chemical in spec-

ified tissues with units corresponding to output.units. Defaults are zero.

plots Plots all outputs if true.

suppress.messages

Whether or not the output message is suppressed.

Species desired (either "Rat", "Rabbit", "Dog", or default "Human"). species

iv.dose Simulates a single i.v. dose if true.

output.units Desired units (either "mg/L", "mg", "umol", or default "uM").

method Method used by integrator (deSolve). rtol Argument passed to integrator (deSolve). atol Argument passed to integrator (deSolve).

default.to.human

Substitutes missing rat values with human values if true.

recalc.blood2plasma

Whether or not to recalculate the blood:plasma chemical concentration ratio recalc.clearance

Whether or not to recalculate the elimination rate.

Vector of dosing times or a matrix consisting of two columns or rows named dosing.matrix

"dose" and "time" containing the time and amount, in mg/kg BW, of each dose.

adjusted.Funbound.plasma

Uses adjusted Funbound.plasma when set to TRUE along with volume of distribution calculated with this value.

regression

Whether or not to use the regressions in calculating partition coefficients in volume of distribution calculation.

restrictive.clearance

In calculating elimination rate, protein binding is not taken into account (set to 1) in liver clearance if FALSE.

minimum.Funbound.plasma

Monte Carlo draws less than this value are set equal to this value (default is 0.0001 – half the lowest measured Fup in our dataset).

monitor.vars

Which variables are returned as a function of time. Defaults value of NULL provides "Agutlumen", "Ccompartment", "Ametabolized", "AUC"

time.varying.params

Whether or not to allow parameters to vary in time according to the nonparametric regression determined by get_input_param_timeseries. Default is TRUE.

start.age

The age of the individual in months at the beginning of the simulation. Default 360.

ref.pop.dt

The output of httkpop_generate containing physiology of the population used in determining timeseries of parameters. Ignored if ref.params is given.

httkpop.generate.arg.list

If ref.pop.dt is NULL, these arguments are used as input to httkpop_generate for generating physiology of a reference population.

ref.params

Model parameters of a reference population used in determining timeseries. Recommended column binding ages in months (as age_months) to the output of create_mc_samples.

... Additional arguments passed to the integrator.

Details

Note that the model parameters have units of hours while the model output is in days.

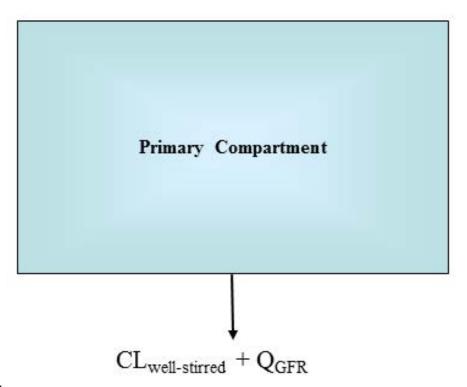

Default value of NULL for doses.per.day solves for a single dose.

When species is specified as rabbit, dog, or mouse, the function uses the appropriate physiological data(volumes and flows) but substitues human fraction unbound, partition coefficients, and intrinsic hepatic clearance.

AUC is area under plasma concentration curve.

Model Figure

Gut Lumen

altalt

Value

)
```

Arguments

| chem.name | Either the chemical name, CAS number, or the parameters must be specified. |
|----------------|--|
| chem.cas | Either the chemical name, CAS number, or the parameters must be specified. |
| dtxsid | EPA's DSSTox Structure ID (http://comptox.epa.gov/dashboard) the chemical must be identified by either CAS, name, or DTXSIDs |
| times | Optional time sequence in days. Dosing sequence begins at the beginning of times. Default is from 0th week of pregnancy to 13th due to model representation. |
| parameters | Chemical parameters from parameterize_1tri_pbtk function, overrides chem.name and chem.cas. |
| days | Length of the simulation. |
| species | Included for compatibility with other functions, but the model will not run for non-human species (default "Human"). |
| tsteps | The number time steps per hour. Default of 4. |
| dose | Amount of a single, initial oral dose in mg/kg BW. |
| dosing.matrix | A matrix of either one column (or row) with a set of dosing times or with two columns (or rows) correspondingly named "dose" and "time" containing the time and amount, in mg/kg BW, of each dose. |
| daily.dose | Total daily dose, mg/kg BW. |
| doses.per.day | Number of doses per day. |
| initial.values | Vector containing the initial concentrations or amounts of the chemical in specified tissues with units corresponding to compartment.units. Defaults are zero. |

plots Plots all outputs if true.

suppress.messages

Whether or not the output message is suppressed.

iv. dose Simulates a single i.v. dose if true.

input.units Input units of interest assigned to dosing, defaults to mg/kg BW

output.units A named vector of output units expected for the model results. Default, NULL,

returns model results in units specified in the 'modelinfo' file. See table below

for details.

physchem.exclude

Exclude chemicals on the basis of physico-chemical properties (currently only Henry's law constant) as specified by the relevant modelinfo_[MODEL] file (de-

fault TRUE).

relevant modelinfo_[MODEL] file (default TRUE).

recalc.blood2plasma

Recalculates the ratio of the amount of chemical in the blood to plasma using the input parameters, calculated with hematocrit, Funbound.plasma, and Krbc2pu.

recalc.clearance

Recalculates the the hepatic clearance (Clmetabolism) with new million.cells.per.gliver parameter.

adjusted.Funbound.plasma

Uses adjusted Funbound.plasma when set to TRUE along with partition coefficients calculated with this value.

regression Whether or not to use the regressions in calculating partition coefficients.

restrictive.clearance

Protein binding not taken into account (set to 1) in liver clearance if FALSE.

minimum.Funbound.plasma

Monte Carlo draws less than this value are set equal to this value (default is 0.0001 – half the lowest measured Fup in our dataset).

monitor.vars Which variables to track by default

Caco2.options A list of options to use when working with Caco2 apical to basolateral data

Caco2.Pab, default is Caco2.options = list(Caco2.Pab.default = 1.6, Caco2.Fabs = TRUE, Caco2.Fgut = TRUE, overwrite.invivo = FALSE, keepit100 = FALSE). Caco2.Pab.default sets the default value for Caco2.Pab if Caco2.Pab is unavailable. Caco2.Fabs = TRUE uses Caco2.Pab to calculate fabs.oral, otherwise fabs.oral = Fabs. Caco2.Fgut = TRUE uses Caco2.Pab to calculate fgut.oral, otherwise fgut.oral = Fgut. overwrite.invivo = TRUE overwrites Fabs and Fgut in vivo values from literature with Caco2 derived values if available. keepit100 = TRUE overwrites Fabs and Fgut with 1 (i.e. 100 percent) regardless of other

settings. See get_fbio for further details.

atol Argument passed to integrator (deSolve).

rtol Argument passed to integrator (deSolve).

. . . Additional arguments passed to the integrator.

Details

The model begins by default at non-pregnancy (0th week) and ends at the 13th week of pregnancy, thereby simulating the 1st trimester. This is meant to augment the fetal_pbtk model (Kapraun et al. 2022) which is limited to the 13th to 40th week window.

Note that the model parameters have units of hours while the model output is in days. Dose is in mg, not scaled for body weight.

Default NULL value for doses.per.day solves for a single dose.

The maternal compartments used in this model are the gut lumen, gut, liver, venous blood, arterial blood, lung, adipose tissue, kidney, thyroid, and rest of body. The "conceptus" compartment models an early developing fetus along with the products of conception (i.e. placenta, amniotic fluid) through which chemical exchange can occur with the maternal blood.

The extra compartments include the amounts or concentrations metabolized by the liver and excreted by the kidneys through the tubules.

AUC is the area under the curve of the plasma concentration.

This gestational model is only parameterized for humans.

Because this model does not simulate exhalation, inhalation, and other processes relevant to volatile chemicals, this model is by default restricted to chemicals with a logHenry's Law Constant less than that of Acetone, a known volatile chemical. That is, chemicals with logHLC > -4.5 (Log10 atm-m3/mole) are excluded. Volatility is not purely determined by the Henry's Law Constant, therefore this chemical exclusion may be turned off with the argument "physchem.exclude = FALSE". Similarly, per- and polyfluoroalkyl substances (PFAS) are excluded by default because the transporters that often drive PFAS toxicokinetics are not included in this model. However, PFAS chemicals can be included with the argument "class.exclude = FALSE".

Value

A matrix of class deSolve with a column for time(in days), each compartment, the area under the curve, and plasma concentration and a row for each time point.

solve_3comp

Solve 3comp

Description

This function solves for the amounts or concentrations of a chemical in the blood of three different compartments representing the body. The volumes of the three compartments are chemical specific, determined from the true tissue volumes multipled by the partition coefficients:

$$V_{pv} = V_{gut}$$

$$V_{liv} = \frac{K_{liv} * f_{up}}{R_{b:p}} V_{liver}$$

$$V_{sc} = \frac{K_{sc} * f_{up}}{R_{b:p}} V_{rest}$$

where "pv" is the portal vein, "liv" is the liver, and "sc" is the systemic compartment; V_gut, V_liver, and V_rest are physiological tissue volumes; K_x are chemical- and tissue-specific equlibrium partition coefficients between tissue and free chemcial concentration in plasma; f_up is the chemical-specific fraction unbound in plasma; and R_b:p is the chemical specific ratio of concentrations in blood:plasma. The blood concentrations evolve according to:

$$\frac{dC_{pv}}{dt} = \frac{1}{V_{pv}} \left(k_{abs} A_{si} + Q_{pv} C_{sc} - Q_{pv} C_{pv} \right)$$

$$\frac{dC_{liv}}{dt} = \frac{1}{V_{liv}} \left(Q_{pv} C_{pv} + Q_{ha} C_{sc} - (Q_{pv} + Q_{ha}) C_{liv} - \frac{1}{R_{b:p}} C l_h C_{liv} \right)$$

$$\frac{dC_{sc}}{dt} = \frac{1}{V_{sc}} \left((Q_{pv} + Q_{ha}) C_{liv} - (Q_{pv} + Q_{ha}) C_{sc} - \frac{f_{up}}{R_{b:p}} * Q_{GFR} * C_{sc} \right)$$

where "ha" is the hepatic artery, Q's are flows, "GFR" is the glomerular filtration rate in the kidney, clearance (scaled up from intrinsic clearance, which does not depend on flow). Plasma concentration in compartment x is given by $C_{x,plasma} = \frac{C_x}{R_{b2p}}$ for a tissue independent value of R_{b2p} .

```

Arguments

| chem.name | Either the chemical name, CAS number, or the parameters must be specified. |
|-----------|--|
| chem.cas | Either the chemical name, CAS number, or the parameters must be specified. |
| dtxsid | $EPA's \ 'DSSTox \ Structure \ ID \ (https://comptox.epa.gov/dashboard) \ the \ chemical \ must be \ identified \ by \ either \ CAS, \ name, \ or \ DTXSIDs$ |

times Optional time sequence for specified number of days. The dosing sequence

begins at the beginning of times.

parameters Chemical parameters from parameterize_3comp function, overrides chem.name

and chem.cas.

days Length of the simulation.

tsteps The number time steps per hour. daily.dose Total daily dose, mg/kg BW.

dose Amount of a single dose, mg/kg BW.

doses.per.day Number of doses per day.

initial.values Vector containing the initial concentrations or amounts of the chemical in spec-

ified tissues with units corresponding to output.units. Defaults are zero.

plots Plots all outputs if true.

suppress.messages

Whether or not the output message is suppressed.

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

iv. dose Simulates a single i.v. dose if true.

input.units Input units of interest assigned to dosing, defaults to mg/kg BW

output.units A named vector of output units expected for the model results. Default, NULL,

returns model results in units specified in the 'modelinfo' file. See table below

for details.

default.to.human

Substitutes missing animal values with human values if true (hepatic intrinsic

clearance or fraction of unbound plasma).

class.exclude Exclude chemical classes identified as outside of domain of applicability by

relevant modelinfo_[MODEL] file (default TRUE).

physchem.exclude

Exclude chemicals on the basis of physico-chemical properties (currently only Henry's law constant) as specified by the relevant modelinfo_[MODEL] file (de-

fault TRUE).

recalc.blood2plasma

Recalculates the ratio of the amount of chemical in the blood to plasma using the input parameters, calculated with hematocrit, Funbound.plasma, and Krbc2pu.

recalc.clearance

Recalculates the the hepatic clearance (Clmetabolism) with new million.cells.per.gliver parameter.

clint.pvalue.threshold

Hepatic clearances with clearance assays having p-values greater than the thresh-

old are set to zero.

dosing.matrix Vector of dosing times or a matrix consisting of two columns or rows named

"dose" and "time" containing the time and amount, in mg/kg BW, of each dose.

adjusted.Funbound.plasma

Uses adjusted Funbound.plasma when set to TRUE along with partition coefficients calculated with this value.

regression Whether or not to use the regressions in calculating partition coefficients.

restrictive.clearance

Protein binding not taken into account (set to 1) in liver clearance if FALSE.

minimum.Funbound.plasma

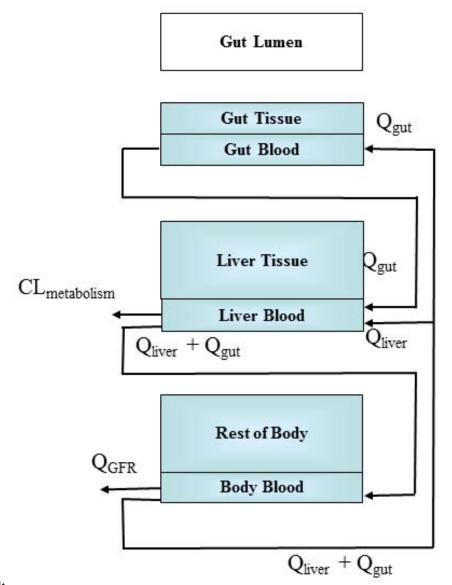

Monte Carlo draws less than this value are set equal to this value (default is 0.0001 – half the lowest measured Fup in our dataset).

Caco2.options

A list of options to use when working with Caco2 apical to basolateral data Caco2.Pab, default is Caco2.options = list(Caco2.Pab.default = 1.6, Caco2.Fabs = TRUE, Caco2.Fgut = TRUE, overwrite.invivo = FALSE, keepit100 = FALSE). Caco2.Pab.default sets the default value for Caco2.Pab if Caco2.Pab is unavailable. Caco2.Fabs = TRUE uses Caco2.Pab to calculate fabs.oral, otherwise fabs.oral = Fabs. Caco2.Fgut = TRUE uses Caco2.Pab to calculate fgut.oral, otherwise fgut.oral = Fgut. overwrite.invivo = TRUE overwrites Fabs and Fgut in vivo values from literature with Caco2 derived values if available. keepit100 = TRUE overwrites Fabs and Fgut with 1 (i.e. 100 percent) regardless of other settings. See get_fbio for further details.

| | monitor.vars | Which variables are returned as a function of time. Defaults value of NULL provides "Cliver", "Csyscomp", "Atubules", "Ametabolized", "AUC" |
|----|--------------------------|---|
| | | Additional arguments passed to the integrator (deSolve). |
| | | |
| | | |
| De | tails | |
| | Note that the time days. | escales for the model parameters have units of hours while the model output is in |
| | Default of NULL | for doses.per.day solves for a single dose. |
| | | s used in this model are the gutlumen, gut, liver, and rest-of-body, with the plasma centration in the blood in the systemic compartment by the blood:plasma ratio. |

```

Arguments

| chem.name | Either the chemical name, CAS number, or the parameters must be specified. |
|------------|--|
| chem.cas | Either the chemical name, CAS number, or the parameters must be specified. |
| dtxsid | EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chemical must be identified by either CAS, name, or DTXSIDs |
| times | Optional time sequence for specified number of days. The dosing sequence begins at the beginning of times. |
| parameters | Chemical parameters from parameterize_3comp function, overrides chem.name and chem.cas. |
| days | Length of the simulation. |

tsteps The number time steps per hour. daily.dose Total daily dose, mg/kg BW.

dose Amount of a single dose, mg/kg BW.

doses.per.day Number of doses per day.

initial.values Vector containing the initial concentrations or amounts of the chemical in spec-

ified tissues with units corresponding to output.units. Defaults are zero.

plots Plots all outputs if true.

suppress.messages

Whether or not the output message is suppressed.

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

route Route of exposure ("inhalation", "intravenous" or [DEFAULT] "oral") passed to

solve_model.

iv. dose Simulates a single i.v. dose if true.

input units Input units of interest assigned to dosing, defaults to mg/kg BW

output.units A named vector of output units expected for the model results. Default, NULL,

returns model results in units specified in the 'modelinfo' file. See table below

for details.

default.to.human

Substitutes missing animal values with human values if true (hepatic intrinsic clearance or fraction of unbound plasma).

physchem.exclude

Exclude chemicals on the basis of physico-chemical properties (currently only Henry's law constant) as specified by the relevant modelinfo_[MODEL] file (de-

fault TRUE).

class.exclude Exclude chemical classes identified as outside of domain of applicability by

relevant modelinfo_[MODEL] file (default TRUE).

recalc.blood2plasma

Recalculates the ratio of the amount of chemical in the blood to plasma using the input parameters, calculated with hematocrit, Funbound.plasma, and Krbc2pu.

recalc.clearance

Recalculates the the hepatic clearance (Clmetabolism) with new million.cells.per.gliver parameter.

clint.pvalue.threshold

Hepatic clearances with clearance assays having p-values greater than the thresh-

old are set to zero.

dosing.matrix Vector of dosing times or a matrix consisting of two columns or rows named

"dose" and "time" containing the time and amount, in mg/kg BW, of each dose.

adjusted.Funbound.plasma

Uses adjusted Funbound.plasma when set to TRUE along with partition coeffi-

cients calculated with this value.

regression Whether or not to use the regressions in calculating partition coefficients.

restrictive.clearance

Protein binding not taken into account (set to 1) in liver clearance if FALSE.

minimum.Funbound.plasma

Monte Carlo draws less than this value are set equal to this value (default is 0.0001 – half the lowest measured Fup in our dataset).

Caco2.options

A list of options to use when working with Caco2 apical to basolateral data Caco2.Pab, default is Caco2.options = list(Caco2.Pab.default = 1.6, Caco2.Fabs = TRUE, Caco2.Fgut = TRUE, overwrite.invivo = FALSE, keepit100 = FALSE). Caco2.Pab.default sets the default value for Caco2.Pab if Caco2.Pab is unavailable. Caco2.Fabs = TRUE uses Caco2.Pab to calculate fabs.oral, otherwise fabs.oral = Fabs. Caco2.Fgut = TRUE uses Caco2.Pab to calculate fgut.oral, otherwise fgut.oral = Fgut. overwrite.invivo = TRUE overwrites Fabs and Fgut in vivo values from literature with Caco2 derived values if available. keepit100 = TRUE overwrites Fabs and Fgut with 1 (i.e. 100 percent) regardless of other settings. See get_fbio for further details.

monitor.vars

Which variables are returned as a function of time. Defaults value of NULL provides "Cliver", "Csyscomp", "Atubules", "Ametabolized", "AUC"

. . . Additional arguments passed to the integrator (deSolve).

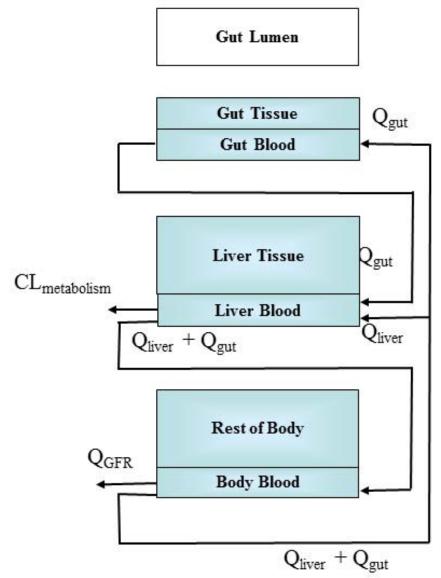

Details

Note that the timescales for the model parameters have units of hours while the model output is in days.

Default of NULL for doses.per.day solves for a single dose.

The compartments used in this model are the gutlumen, gut, liver, and rest-of-body, with the plasma related to the concentration in the blood in the systemic compartment by the blood:plasma ratio.

Model Figure

altalt

When species is specified as rabbit, dog, or mouse, the function uses the appropriate physiological data(volumes and flows) but substitues human fraction unbound, partition coefficients, and intrinsic hepatic clearance.

Per- and polyfluoroalkyl substances (PFAS) are excluded by default because the transporters that often drive PFAS toxicokinetics are not included in this model. However, PFAS chemicals can be included with the argument "class.exclude = FALSE".

Value

A matrix of class deSolve with a column for time(in days) and each compartment, the plasma concentration, area under the curve, and a row for each time point.

Arguments

chem. name Either the chemical name, CAS number, or the parameters must be specified.

chem. cas Either the chemical name, CAS number, or the parameters must be specified.

dtxsid EPA's 'DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chem-

ical must be identified by either CAS, name, or DTXSIDs

times Optional time sequence for specified number of days. The dosing sequence

begins at the beginning of times.

parameters Chemical parameters from parameterize_3comp function, overrides chem.name

and chem.cas.

days Length of the simulation.

tsteps The number time steps per hour.
daily.dose Total daily dose, mg/kg BW.

dose Amount of a single dose, mg/kg BW.

doses.per.day Number of doses per day.

initial.values Vector containing the initial concentrations or amounts of the chemical in spec-

ified tissues with units corresponding to output.units. Defaults are zero.

plots Plots all outputs if true.

suppress.messages

Whether or not the output message is suppressed.

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

iv. dose Simulates a single i.v. dose if true.

input.units Input units of interest assigned to dosing, defaults to mg/kg BW

output.units A named vector of output units expected for the model results. Default, NULL,

returns model results in units specified in the 'modelinfo' file. See table below

for details.

default.to.human

Substitutes missing animal values with human values if true (hepatic intrinsic

clearance or fraction of unbound plasma).

recalc.blood2plasma

Recalculates the ratio of the amount of chemical in the blood to plasma using the input parameters, calculated with hematocrit, Funbound.plasma, and Krbc2pu.

recalc.clearance

Recalculates the the hepatic clearance (Clmetabolism) with new million.cells.per.gliver parameter.

clint.pvalue.threshold

Hepatic clearances with clearance assays having p-values greater than the threshold are set to zero.

dosing.matrix Ve

Vector of dosing times or a matrix consisting of two columns or rows named "dose" and "time" containing the time and amount, in mg/kg BW, of each dose.

adjusted.Funbound.plasma

Uses adjusted Funbound.plasma when set to TRUE along with partition coefficients calculated with this value.

regression

Whether or not to use the regressions in calculating partition coefficients.

restrictive.clearance

Protein binding not taken into account (set to 1) in liver clearance if FALSE.

minimum.Funbound.plasma

Monte Carlo draws less than this value are set equal to this value (default is 0.0001 – half the lowest measured Fup in our dataset).

Caco2.options

A list of options to use when working with Caco2 apical to basolateral data Caco2.Pab, default is Caco2.options = list(Caco2.Pab.default = 1.6, Caco2.Fabs = TRUE, Caco2.Fgut = TRUE, overwrite.invivo = FALSE, keepit100 = FALSE). Caco2.Pab.default sets the default value for Caco2.Pab if Caco2.Pab is unavailable. Caco2.Fabs = TRUE uses Caco2.Pab to calculate fabs.oral, otherwise fabs.oral = Fabs. Caco2.Fgut = TRUE uses Caco2.Pab to calculate fgut.oral, otherwise fgut.oral = Fgut. overwrite.invivo = TRUE overwrites Fabs and Fgut in vivo values from literature with Caco2 derived values if available. keepit100 = TRUE overwrites Fabs and Fgut with 1 (i.e. 100 percent) regardless of other settings. See get_fbio for further details.

monitor.vars

Which variables are returned as a function of time. Defaults value of NULL provides "Cliver", "Csyscomp", "Atubules", "Ametabolized", "AUC"

time.varying.params

Whether or not to allow parameters to vary in time according to the nonparametric regression determined by get_input_param_timeseries. Default is TRUE.

start.age

The age of the individual in months at the beginning of the simulation. Default 360

ref.pop.dt

The output of httkpop_generate containing physiology of the population used in determining timeseries of parameters. Ignored if ref.params is given.

httkpop.generate.arg.list

If ref.pop.dt is NULL, these arguments are used as input to httkpop_generate for generating physiology of a reference population.

ref.params

Model parameters of a reference population used in determining timeseries. Recommended column binding ages in months (as age_months) to the output of create_mc_samples.

... Additional arguments passed to the integrator (deSolve).

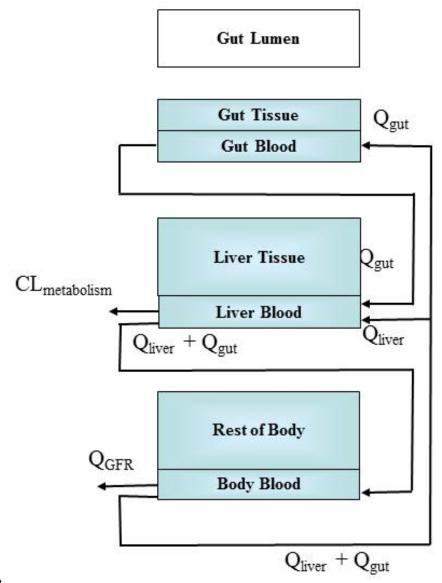

Details

Note that the timescales for the model parameters have units of hours while the model output is in days.

Default of NULL for doses.per.day solves for a single dose.

The compartments used in this model are the gutlumen, gut, liver, and rest-of-body, with the plasma related to the concentration in the blood in the systemic compartment by the blood:plasma ratio.

Model Figure

altalt

When species is specified as rabbit, dog, or mouse, the function uses the appropriate physiological data(volumes and flows) but substitues human fraction unbound, partition coefficients, and intrinsic hepatic clearance.

Value

A matrix of class deSolve with a column for time(in days) and each compartment, the plasma concentration, area under the curve, and a row for each time point.

)
```

Arguments

| chem.name | Either the chemical name, CAS number, or the parameters must be specified. |
|------------|---|
| chem.cas | Either the chemical name, CAS number, or the parameters must be specified. |
| dtxsid | EPA's DSSTox Structure ID (http://comptox.epa.gov/dashboard) the chemical must be identified by either CAS, name, or DTXSIDs. |
| model.tvpe | Choice of dermal model, either the default "dermal 1subcomp" for the model |

with 1 compartment for the skin; or "dermal" for the model with 2 sub compartments for skin: the stratum corneum (SC) and the combined viable epidermis and dermis (ED).

method.permeability

For "dermal_1subcomp" model, method of calculating the permeability coefficient, P, either "Potts-Guy" or "UK-Surrey". Default is "UK-Surrey" (Sawyer et al., 2016 and Chen et al., 2015), which uses Fick's law of diffusion to calculate P. For "dermal" model, this parameter is ignored.

Kvehicle2water Partition coefficient for the vehicle (sometimes called the media) carrying the

chemical to water. Default is "water", which assumes the vehicle is water. Other

optional inputs are "octanol" and "olive oil".

times Optional time sequence for specified number of days. Dosing sequence begins

at the beginning of times.

parameters Chemical parameters from parameterize dermal pbtk function, overrides chem.name

and chem.cas.

days Length of the simulation. If "times" input is used, this is ignored.

tsteps The number time steps per hour.

plots Plots all outputs if true.

monitor.vars Which variables are returned as a function of time. Default values of NULL

looks up variables specified in modelinfo_MODEL.R

suppress.messages

Whether or not the output message is suppressed.

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

method Method used by integrator (ode).

rtol Argument passed to integrator (ode).

atol Argument passed to integrator (ode).

recalc.blood2plasma

Recalculates the ratio of the amount of chemical in the blood to plasma using the input parameters, calculated with hematocrit, Funbound.plasma, and Krbc2pu.

recalc.clearance

Recalculates the the hepatic clearance (Clmetabolism) with new million.cells.per.gliver parameter.

adjusted.Funbound.plasma

Uses adjusted Funbound.plasma when set to TRUE along with partition coefficients calculated with this value.

minimum.Funbound.plasma

Monte Carlo draws less than this value are set equal to this value (default is 0.0001 – half the lowest measured Fup in our dataset).

parameterize.arg.list

Additional parameterized passed to the model parameterization function, "parameterize_dermal_pbtk". The inputs "model.type", "method.permeability", and "Kvehicle2water" are not passed through this.

Kveinciezwater are not passed unrough tins.

route Route of exposure, can be "oral" OR "iv" OR "dermal" (default).

Vvehicle Volume of vehicle applied to skin in L, defaults to 0.1 L. If InfiniteDose=TRUE,

this parameter is ignored and set = 1.

initial.dose Initial exposure dose. If InfiniteDose=TRUE, this is a concentration, otherwise,

this is an amount.

daily.dose Total daily dose, defaults to mg/kg BW.

doses.per.day Number of doses per day.

input.units Exposure units applied to initial.dose and/or dosing.dermal. If InfiniteDose=TRUE,

must be a concentration, e.g., "mg/kg/L" (default), otherwise, must be an amount,

e.g., "mg/kg" (default).

dose.duration Amount of time dermal dose is on skin before being washed off. Note that when

dose.duration is used, washoff=TRUE.

dose.duration.units

Units for dose.duration, can be "minutes" OR "hours" OR "days" (default).

dosing.dermal Matrix consisting of three columns named "Cvehicle", "Vvehicle", and "time"

containing the dosing times, days, with the applied amount in the vehicle, and the volume of the applied vehicle, L. Note that the units of Cvehicle are controlled by input.units. **If InfiniteDose=TRUE, the Vvehicle column of dos-

ing.dermal is ignored.**

dosing.matrix Vector of dosing times or a matrix consisting of two columns or rows named

"dose" and "time" containing the time and amount, in mg/kg BW, of each dose.

washoff If TRUE, any chemical left on the skin is assumed to be replaced by new dose

(i.e., wash-off occurs before new dose is administered). If FALSE (default), any

chemical left on the skin is added to the new dose.

InfiniteDose Is there so much compound in the vehicle that it does not deplete?

. . . Additional arguments passed to the integrator (ode).

Details

The user can input dermal doses via one of three options:

"dose.duration" User can input the length of exposure time for one dermal dose before wash-off occurs. Note that initial dose can be used to change the initial dose used along with this option.

"dosing.dermal" With this option, users can input multiple doses over time as a matrix with columns for time, the volume of vehicle administered, and the concentration of the vehicle administered. Note that the parameter washoff can be used to specify whether chemical is washed off in between doses.

"dosing.matrix" This option is also used to describe multiple exposure doses over time, and is described in the help file of solve_model. Note that unlike dosing.dermal, Vvehicle cannot be changed with this option.

Model units are the same as vehicle concentration, units/L or units when use.amounts=TRUE.

New doses replace rather than add to previous doses. A concentration of 0 in dosing.matrix switches off the dosing/diffusion between the vehicle and exposed skin.

Note that the model parameters have units of hours while the model output is in days.

The compartments used in this model are the gutlumen, gut, liver, kidneys, veins, arteries, lungs, unexposed skin, exposed skin, vehicle, and the rest of the body. When model type = "dermal", a 2-compartment model is used where skin is divided into the stratum corneum, SC, and the combined viable epidermis and dermis, ED.

The extra compartments include the amounts or concentrations metabolized by the liver and excreted by the kidneys through the tubules.

AUC is the area under the curve of the plasma concentration.

When species is specified as rabbit, dog, or mouse, the function uses the appropriate physiological data(volumes and flows) but substitutes human fraction unbound, partition coefficients, and intrinsic hepatic clearance.

Value

A matrix of class deSolve with a column for time (in days), each compartment, the area under the curve, and plasma concentration and a row for each time point.

  class.exclude = TRUE,
  recalc.blood2plasma = FALSE,
  recalc.clearance = FALSE,
  adjusted.Funbound.plasma = TRUE,
```

```
regression = TRUE,
restrictive.clearance = TRUE,
minimum.Funbound.plasma = 1e-04,
monitor.vars = NULL,
Caco2.options = list(),
atol = 1e-06,
rtol = 1e-06,
...
)
```

Arguments

chem. name Either the chemical name, CAS number, or the parameters must be specified.

Chem. cas Either the chemical name, CAS number, or the parameters must be specified.

dtxsid EPA's DSSTox Structure ID (http://comptox.epa.gov/dashboard) the chem-

ical must be identified by either CAS, name, or DTXSIDs

times Optional time sequence in days. Dosing sequence begins at the beginning of

times. Default is from 13th week of pregnancy to 40th due to data constraints.

parameters Chemical parameters from parameterize_fetal_pbtk function, overrides chem.name

and chem.cas.

days Length of the simulation.

species Included for compatibility with other functions, but the model will not run for

non-human species (default "Human").

tsteps The number time steps per hour. Default of 4.

dose Amount of a single, initial oral dose in mg/kg BW.

dosing.matrix A matrix of either one column (or row) with a set of dosing times or with two

columns (or rows) correspondingly named "dose" and "time" containing the time

and amount, in mg/kg BW, of each dose.

daily.dose Total daily dose, mg/kg BW.

doses.per.day Number of doses per day.

initial.values Vector containing the initial concentrations or amounts of the chemical in spec-

ified tissues with units corresponding to compartment.units. Defaults are zero.

plots Plots all outputs if true.

suppress.messages

Whether or not the output message is suppressed.

iv. dose Simulates a single i.v. dose if true.

input.units Input units of interest assigned to dosing, defaults to mg/kg BW

output.units A named vector of output units expected for the model results. Default, NULL,

returns model results in units specified in the 'modelinfo' file. See table below

for details.

physchem.exclude

Exclude chemicals on the basis of physico-chemical properties (currently only Henry's law constant) as specified by the relevant modelinfo_[MODEL] file (de-

fault TRUE).

class.exclude Exclude chemical classes identified as outside of domain of applicability by relevant modelinfo_[MODEL] file (default TRUE).

recalc.blood2plasma

Recalculates the ratio of the amount of chemical in the blood to plasma using the input parameters, calculated with hematocrit, Funbound.plasma, and Krbc2pu.

recalc.clearance

Recalculates the the hepatic clearance (Clmetabolism) with new million.cells.per.gliver parameter.

adjusted.Funbound.plasma

Uses adjusted Funbound.plasma when set to TRUE along with partition coefficients calculated with this value.

regression Whether or not to use the regressions in calculating partition coefficients. restrictive.clearance

Protein binding not taken into account (set to 1) in liver clearance if FALSE.

minimum.Funbound.plasma

Monte Carlo draws less than this value are set equal to this value (default is 0.0001 – half the lowest measured Fup in our dataset).

monitor.vars Which variables to track by default

Caco2.options A list of options to use when working with Caco2 apical to basolateral data

Caco2.Pab, default is Caco2.options = list(Caco2.Pab.default = 1.6, Caco2.Fabs = TRUE, Caco2.Fgut = TRUE, overwrite.invivo = FALSE, keepit100 = FALSE). Caco2.Pab.default sets the default value for Caco2.Pab if Caco2.Pab is unavailable. Caco2.Fabs = TRUE uses Caco2.Pab to calculate fabs.oral, otherwise fabs.oral = Fabs. Caco2.Fgut = TRUE uses Caco2.Pab to calculate fgut.oral, otherwise fgut.oral = Fgut. overwrite.invivo = TRUE overwrites Fabs and Fgut in vivo values from literature with Caco2 derived values if available. keepit100 = TRUE overwrites Fabs and Fgut with 1 (i.e. 100 percent) regardless of other

settings. See get_fbio for further details.

atol Absolute tolerance used by integrator (deSolve) to determine numerical precision—

defaults to 1e-8.

rtol Relative tolerance used by integrator (deSolve) to determine numerical precision

- defaults to 1e-8.

... Additional arguments passed to the integrator.

Details

The stage of pregnancy simulated here begins by default at the 13th week due to a relative lack of data to support parameterization prior, in line with the recommendations of Kapraun et al. 2019 ("Empirical models for anatomical and physiological..."), and ends at the 40th week of pregnancy.

Note that the model parameters have units of hours while the model output is in days. Dose is in mg, not scaled for body weight.

Default NULL value for doses.per.day solves for a single dose.

The maternal compartments used in this model are the gut lumen, gut, liver, venous blood, arterial blood, lung, adipose tissue, kidney, thyroid, and rest of body. A placenta is modeled as a joint organ shared by mother and fetus, through which chemical exchange can occur with the fetus. Fetal

compartments include arterial blood, venous blood, kidney, thyroid, liver, lung, gut, brain, and rest of body.

The extra compartments include the amounts or concentrations metabolized by the liver and excreted by the kidneys through the tubules.

AUC is the area under the curve of the plasma concentration.

This gestational model is only parameterized for humans.

Because this model does not simulate exhalation, inhalation, and other processes relevant to volatile chemicals, this model is by default restricted to chemicals with a logHenry's Law Constant less than that of Acetone, a known volatile chemical. That is, chemicals with logHLC > -4.5 (Log10 atm-m3/mole) are excluded. Volatility is not purely determined by the Henry's Law Constant, therefore this chemical exclusion may be turned off with the argument "physchem.exclude = FALSE". Similarly, per- and polyfluoroalkyl substances (PFAS) are excluded by default because the transporters that often drive PFAS toxicokinetics are not included in this model. However, PFAS chemicals can be included with the argument "class.exclude = FALSE".

Value

A matrix of class deSolve with a column for time(in days), each compartment, the area under the curve, and plasma concentration and a row for each time point.

```

```
solve_full_pregnancy
```

Description

This function solves for the amounts (in umol) or concentrations (in uM) of a chemical in different tissues of a maternal-fetal system over the full course of human pregnancy given a dose and dosing frequency.

Usage

```
solve_full_pregnancy(
  chem.name = NULL,
  chem.cas = NULL,
  dtxsid = NULL,
  time.course = seq(0, 40 * 7, 1),
  dose = NULL,
  daily.dose = NULL,
  doses.per.day = NULL,
  class.exclude = TRUE,
  physchem.exclude = TRUE,
  track.vars = NULL,
  plt = FALSE
)
```

Arguments

chem. name Either the chemical name, CAS number, or DTXSID must be specified.

chem. cas Either the chemical name, CAS number, or DTXSID must be specified.

dtxsid EPA's DSSTox Structure ID (http://comptox.epa.gov/dashboard)

Time sequence in days. Default is from 0th week of pregnancy to 40th, incremented by day.

solve_full_pregnancy 355

dose Amount of a single, initial dose (on day 0) in mg/kg BW.

daily.dose Total daily dose, mg/kg BW for 40 weeks.

doses.per.day Number of doses per day for 40 weeks.

class.exclude Exclude chemical classes identified as outside of domain of applicability for

fetal_pbtk and 1tri_pbtk models (i.e. PFAS chemicals).

physchem.exclude

Exclude chemicals on the basis of physico-chemical properties (currently only Henry's law constant) as specified by the modelinfo files for fetal_pbtk and

1tri pbtk.

track.vars which variables to return in solution output dataframe

plt plots all outputs, if TRUE

Details

The simulation starts at the 0th week and ends at 40 weeks of pregnancy (term), covering all trimesters of human pregnancy. This is accomplished by stitching together the 1tri and fetal PBTK models with appropriate initial conditions, as described in Truong et al. (TBD).

Value

A matrix with columns for time (in days), each compartment, the area under the curve (for plasma vs time), and plasma, and a row for each time point.

solve_gas_pbtk

solve_gas_pbtk

Description

This function solves for the amounts or concentrations of a chemical in different tissues as functions of time as a result of inhalation exposure to an ideal gas. In this PBTK formulation. C_{tissue} is the concentration in tissue at time t. Since the perfusion limited partition coefficients describe instantaneous equilibrium between the tissue and the free fraction in plasma, the whole plasma concentration is $C_{tissue,plasma} = \frac{1}{f_{up}*K_{tissue2fup}}*C_{tissue}$. Note that we use a single, constant value of f_{up} across all tissues. Corespondingly the free plasma concentration is modeled as $C_{tissue,freeplasma} = \frac{1}{K_{tissue2fup}}*C_{tissue}$. The amount of blood flowing from tissue x is Q_{tissue} (L/h) at a concentration $C_{x,blood} = \frac{R_{b2p}}{f_{up}*K_{tissue2fup}}*C_{tissue}$, where we use a single R_{b2p} value

throughout the body. Metabolic clearance is modelled as being from the total plasma concentration here, though it is restricted to the free fraction in calc_hep_clearance by default. Renal clearance via glomerulsr filtration is from the free plasma concentration.

Usage

```
solve_gas_pbtk(
  chem.name = NULL,
  chem.cas = NULL,

```

Arguments

dtxsid

chem. name Either the chemical name, CAS number, or the parameters must be specified.

Chem. cas Either the chemical name, CAS number, or the parameters must be specified.

EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chem-

ical must be identified by either CAS, name, or DTXSIDs

parameters Chemical parameters from parameterize_gas_pbtk (or other bespoke) function,

overrides chem.name and chem.cas.

times Optional time sequence for specified number of days. Dosing sequence begins

at the beginning of times.

days Length of the simulation.

tsteps The number of time steps per hour.

daily.dose Total daily dose

doses . per . day Number of doses per day.

dose Amount of a single dose

dosing.matrix Vector of dosing times or a matrix consisting of two columns or rows named

"dose" and "time" containing the time and amount of each dose.

forcings Manual input of 'forcings' data series argument for ode integrator. If left un-

specified, 'forcings' defaults to NULL, and then other input parameters (see exp.start.time, exp.conc, exp.duration, and period) provide the necessary infor-

mation to assemble a forcings data series.

exp.start.time Start time in specifying forcing exposure series, default 0.

exp.conc Specified inhalation exposure concentration for use in assembling "forcings"

data series argument for integrator. Defaults to units of ppmv.

period For use in assembling forcing function data series 'forcings' argument, specified

in hours

exp. duration For use in assembling forcing function data series 'forcings' argument, specified

in hours

initial.values Vector containing the initial concentrations or amounts of the chemical in spec-

ified tissues with units corresponding to those specified for the model outputs.

Default values are zero.

plots Plots all outputs if true.

suppress.messages

Whether or not the output message is suppressed.

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

iv. dose Simulates a single i.v. dose if true.

input units Input units of interest assigned to dosing, including forcings. Defaults to "ppmv"

as applied to the default forcings scheme.

output.units A named vector of output units expected for the model results. Default, NULL,

returns model results in units specified in the 'modelinfo' file. See table below

for details.

default.to.human

Substitutes missing animal values with human values if true (hepatic intrinsic clearance or fraction of unbound plasma).

class.exclude Exclude chemical classes identified as outside of domain of applicability by relevant modelinfo [MODEL] file (default TRUE).

physchem.exclude

Exclude chemicals on the basis of physico-chemical properties (currently only Henry's law constant) as specified by the relevant modelinfo_[MODEL] file (default TRUE).

recalc.blood2plasma

Recalculates the ratio of the amount of chemical in the blood to plasma using the input parameters, calculated with hematocrit, Funbound.plasma, and Krbc2pu.

recalc.clearance

Recalculates the hepatic clearance (Clmetabolism) with new million.cells.per.gliver parameter.

adjusted.Funbound.plasma

Uses adjusted Funbound.plasma when set to TRUE along with partition coefficients calculated with this value.

regression Whether or not to use the regressions in calculating partition coefficients.

restrictive.clearance

Protein binding not taken into account (set to 1) in liver clearance if FALSE. (Default is FALSE.)

minimum.Funbound.plasma

Monte Carlo draws less than this value are set equal to this value (default is 0.0001 – half the lowest measured Fup in our dataset).

monitor.vars Which variables are returned as a function of time. Defaults value of NULL pro-

vides "Cgut", "Cliver", "Cven", "Clung", "Cart", "Crest", "Ckidney", "Cplasma", "Calv", "Cendexh", "Cmixexh", "Cmuc", "Atubules", "Ametabolized", "AUC"

vmax Michaelis-Menten vmax value in reactions/min

km Michaelis-Menten concentration of half-maximal reaction velocity in desired

output concentration units.

exercise Logical indicator of whether to simulate an exercise-induced heightened respi-

ration rate

fR Respiratory frequency (breaths/minute), used especially to adjust breathing rate

in the case of exercise. This parameter, along with VT and VD (below) gives another option for calculating Qalv (Alveolar ventilation) in case pulmonary

ventilation rate is not known

VT Tidal volume (L), to be modulated especially as part of simulating the state of

exercise

VD Anatomical dead space (L), to be modulated especially as part of simulating the

state of exercise

Caco2.options A list of options to use when working with Caco2 apical to basolateral data

Caco2.Pab, default is Caco2.options = list(Caco2.Pab.default = 1.6, Caco2.Fabs = TRUE, Caco2.Fgut = TRUE, overwrite.invivo = FALSE, keepit100 = FALSE).

Caco2.Pab.default sets the default value for Caco2.Pab if Caco2.Pab is unavailable. Caco2.Fabs = TRUE uses Caco2.Pab to calculate fabs.oral, otherwise fabs.oral = Fabs. Caco2.Fgut = TRUE uses Caco2.Pab to calculate fgut.oral, otherwise fgut.oral = Fgut. overwrite.invivo = TRUE overwrites Fabs and Fgut in vivo values from literature with Caco2 derived values if available. keepit100 = TRUE overwrites Fabs and Fgut with 1 (i.e. 100 percent) regardless of other settings. See get_fbio for further details.

. . .

Additional arguments passed to the integrator (deSolve). (Note: There are precision differences between M1 Mac and other OS systems for this function due to how long doubles are handled. To replicate results between various OS systems we suggest changing the default method of "lsoda" to "lsode" and also adding the argument mf = 10. See [deSolve::ode()] for further details.)

Details

The default dosing scheme involves a specification of the start time of exposure (exp.start.time), the concentration of gas inhaled (exp.conc), the period of a cycle of exposure and non-exposure (period), the duration of the exposure during that period (exp.duration), and the total days simulated. Together, these arguments determine the "forcings" passed to the ODE integrator. Forcings can also be specified manually, or effectively turned off by setting exposure concentration to zero, if the user prefers to simulate dosing by other means.

The "forcings" object is configured to be passed to the integrator with, at the most, a basic unit conversion among ppmv, mg/L, and uM. No scaling by BW is set to be performed on the forcings series.

Note that the model parameters have units of hours while the model output is in days.

Default NULL value for doses.per.day solves for a single dose.

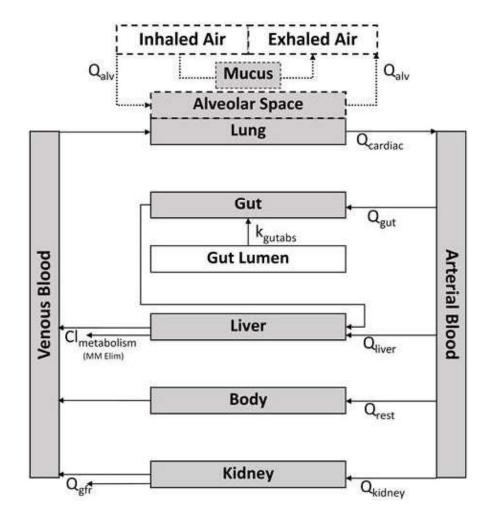

The compartments used in this model are the gut lumen, gut, liver, kidneys, veins, arteries, lungs, and the rest of the body.

The extra compartments include the amounts or concentrations metabolized by the liver and excreted by the kidneys through the tubules.

AUC is the area under the curve of the plasma concentration.

Model Figure from (Linakis et al. 2020):

solve_gas_pbtk 361

altalt

Model parameters are named according to the following convention:

| prefix | suffic | Meaning | units |
|--------|--------|--|---|
| K | | Partition coefficient for tissue to free plasma \ tab unitless | |
| V | | Volume | L |
| Q | | Flow | L/h |
| k | | Rate | 1/h |
| | c | Parameter is proportional to body weight | $1 / \text{kg}$ for volumes and $1/\text{kg}^{(3/4)}$ for flows |

When species is specified but chemical-specific in vitro data are not available, the function uses the

362 solve_gas_pbtk

appropriate physiological data (volumes and flows) but default.to.human = TRUE must be used to substitute human fraction unbound, partition coefficients, and intrinsic hepatic clearance.

Per- and polyfluoroalkyl substances (PFAS) are excluded by default because the transporters that often drive PFAS toxicokinetics are not included in this model. However, PFAS chemicals can be included with the argument "class.exclude = FALSE".

Value

A matrix of class deSolve with a column for time(in days), each compartment, the area under the curve, and plasma concentration and a row for each time point.

solve_model

Solve_model

Description

solve_model is designed to accept systematized metadata (provided by the model.list defined in the modelinfo files) for a given toxicokinetic model, including names of variables, parameterization functions, and key units, and use it along with chemical information to prepare an ode system for numerical solution over time of the amounts or concentrations of chemical in different bodily compartments of a given species (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

Usage

```
solve_model(
  chem.name = NULL,
  chem.cas = NULL,
  dtxsid = NULL,
  times = NULL,
  parameters = NULL,
 model = NULL,
  route = "oral",
  dosing = NULL,
  days = 10,
  tsteps = 4,
  initial.values = NULL,
  initial.value.units = NULL,
  plots = FALSE,
 monitor.vars = NULL,
  suppress.messages = FALSE,
  species = "Human",
  input.units = "mg/kg",
  output.units = NULL,
```

```
method = NULL,
rtol = 1e-06,
atol = 1e-06,
hmin = 1e-08,
recalc.blood2plasma = FALSE,
recalc.clearance = FALSE,
parameterize.args.list = list(),
small.time = 1e-04,
forcings = NULL,
...
)
```

Arguments

chem. name Either the chemical name, CAS number, or the parameters must be specified.

chem. cas Either the chemical name, CAS number, or the parameters must be specified.

dtxsid EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chem-

ical must be identified by either CAS, name, or DTXSIDs

times Optional time sequence for specified number of output times (in days) to be

returned by the function. The model is solved explicitly at the time sequence

specified. Dosing sequence begins at the first time provided.

parameters List of chemical parameters, as output by parameterize_pbtk function. Over-

rides chem.name and chem.cas.

model Specified model to use in simulation: "pbtk", "3compartment", "3compartmentss",

"1compartment", "schmitt", ...

route String specification of route of exposure for simulation: "oral", "iv", "inhala-

tion", ...

dosing List of dosing metrics used in simulation, which includes the namesake en-

tries of a model's associated dosing.params. In the case of most httk models, these should include "initial.dose", "doses.per.day", "daily.dose", and "dosing.matrix". The "dosing.matrix" is used for more precise dose regimen specification, and is a matrix consisting of two columns or rows named "time" and "dose" containing the time and amount of each dose. If none of the namesake entries of the dosing list is set to a non-NULL value, solve_model uses a default initial dose of 1 mg/kg BW along with the dose type (add/multiply) specified for

a given route (for example, add the dose to gut lumen for oral route)

days Simulated period. Default 10 days.

tsteps The number of time steps per hour. Default of 4.

initial.values Vector of numeric values containing the initial concentrations or amounts of the

chemical in specified tissues with units corresponding to those specified for the

model outputs. Default values are zero.

initial.value.units

Vector of character strings containing the units corresponding to 'initial.values' specified for the model outputs. Default is assuming the units match expected compartment units for the model.

plots Plots all outputs if true.

monitor.vars Which variables are returned as a function of time. Default values of NULL

looks up variables specified in modelinfo_MODEL.R

suppress.messages

Whether or not the output messages are suppressed.

species Species desired (models have been designed to be parameterized for some sub-

set of the following species: "Rat", "Rabbit", "Dog", "Mouse", or default "Hu-

man").

input units Input units of interest assigned to dosing. Defaults to mg/kg BW, in line with the

default dosing scheme of a one-time dose of 1 mg/kg in which no other dosing

parameters are specified.

output units Output units of interest for the compiled components. Defaults to NULL, and

will provide values in model units if unspecified.

method Method used by integrator (ode).

rtol Relative tolerance used by integrator (ode) to determine numerical precision –

defaults to 1e-6.

atol Absolute tolerance used by integrator (ode) to determine numerical precision –

defaults to 1e-6.

hmin minimum value of the integration stepsize (ode) – defaults to 1e-8

recalc.blood2plasma

Recalculates the ratio of the amount of chemical in the blood to plasma using the input parameters, calculated with hematocrit, Funbound.plasma, and Krbc2pu.

recalc.clearance

Recalculates the the hepatic clearance (Clmetabolism) with new million.cells.per.gliver parameter.

parameterize.args.list

Additional parameters passed to the model parameterization function (other than chemical identifier, 'species', 'suppress.messages', 'restrictive.clearance', 'ad-

justed.Funbound.plasma', and 'minimum.Funbound.plasma')

small.time A tiny amount of time used to provide predictions on either side of an instan-

taneous event (like an iv injection). This helps ensure that abrupt changes plot

well. Defaults to 1e-4.

forcings A way of passing time-dependent quantities to the ODE solver. Should take

the form of a list of two-column matrices with the first column containing time values and the second column the value of quantity at those times. Default

NULL.

... Additional arguments passed to the integrator.

Details

Dosing values with certain acceptable associated input.units (like mg/kg BW) are configured to undergo a unit conversion. All model simulations are intended to run with units as specifed by "compartment.units" in the model.list (as defined by the modelinfo files).

The 'dosing' argument includes all parameters needed to describe exposure in terms of route of administration, frequency, and quantity short of scenarios that require use of a more precise forcing

function. If the dosing argument's namesake entries are left NULL, solve_model defaults to a single-time dose of 1 mg/kg BW according to the given dosing route and associated type (either add/multiply, for example we typically add a dose to gut lumen when oral route is specified).

AUC is the area under the curve of the plasma concentration.

Model parameters are named according to the following convention:

| prefix | suffix | Meaning | units |
|--------|--------|--|---|
| K | | Partition coefficient for tissue to free plasma \ tab unitless | |
| V | | Volume | L |
| Q | | Flow | L/h |
| k | | Rate | 1/h |
| | c | Parameter is proportional to body weight | 1 / kg for volumes and 1/kg^(3/4) for flows |

When species is specified but chemical-specific in vitro data are not available, the function uses the appropriate physiological data (volumes and flows) but default.to.human = TRUE must be used to substitute human fraction unbound, partition coefficients, and intrinsic hepatic clearance. (NOTE: The 'default.to.human' specification should be included as part of the arguments listed in 'parameterize.args.list'.)

For both plotting purposes and helping the numerical equation solver, it is helpful to specify that time points shortly before and after dosing are included. This function automatically add these points, and they are returned to the user unless the times argument is used, in which case only the time points specified by that argument are provided.

Value

A matrix of class deSolve with a column for time(in days), each compartment, the area under the curve, and plasma concentration and a row for each time point.

 $solve_pbtk$

Solve_PBTK

Description

This function solves for the amounts or concentrations in uM of a chemical in different tissues as functions of time based on the dose and dosing frequency. In this PBTK formulation. C_{tissue} is the concentration in tissue at time t. Since the perfusion limited partition coefficients describe

instantaneous equilibrium between the tissue and the free fraction in plasma, the whole plasma concentration is $C_{tissue,plasma} = \frac{1}{f_{up}*K_{tissue2fup}}*C_{tissue}$. Note that we use a single, constant value of f_{up} across all tissues. Corespondingly the free plasma concentration is modeled as $C_{tissue,freeplasma} = \frac{1}{K_{tissue2fup}}*C_{tissue}$. The amount of blood flowing from tissue x is Q_{tissue} (L/h) at a concentration $C_{x,blood} = \frac{R_{b2p}}{f_{up}*K_{tissue2fup}}*C_{tissue}$, where we use a single R_{b2p} value throughout the body. Metabolic clearance is modelled as being from the total plasma concentration here, though it is restricted to the free fraction in calc_hep_clearance by default. Renal clearance via glomerulsr filtration is from the free plasma concentration. The compartments used in this model are the gutlumen, gut, liver, kidneys, veins, arteries, lungs, and the rest of the body. The extra compartments include the amounts or concentrations metabolized by the liver and excreted by the kidneys through the tubules. AUC is the area under the curve of the plasma concentration.

)
```

Arguments

chem. name Either the chemical name, CAS number, or the parameters must be specified.

chem. cas Either the chemical name, CAS number, or the parameters must be specified.

dtxsid EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chem-

ical must be identified by either CAS, name, or DTXSIDs

times Optional time sequence for specified number of days. Dosing sequence begins

at the beginning of times.

parameters Chemical parameters from parameterize_pbtk function, overrides chem.name

and chem.cas.

days Length of the simulation.

tsteps The number of time steps per hour.

daily.dose Total daily dose, defaults to mg/kg BW.

dose Amount of a single, initial oral dose in mg/kg BW.

doses.per.day Number of doses per day.

initial.values Vector containing the initial concentrations or amounts of the chemical in spec-

ified tissues with units corresponding to output.units. Defaults are zero.

plots Plots all outputs if true.

suppress.messages

Whether or not the output message is suppressed.

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

iv. dose Simulates a single i.v. dose if true.

input.units Input units of interest assigned to dosing, defaults to mg/kg BW

output.units A named vector of output units expected for the model results. Default, NULL,

returns model results in units specified in the 'modelinfo' file. See table below

for details.

default.to.human

Substitutes missing animal values with human values if true (hepatic intrinsic

clearance or fraction of unbound plasma).

class.exclude Exclude chemical classes identified as outside of domain of applicability by

relevant modelinfo_[MODEL] file (default TRUE).

physchem.exclude

Exclude chemicals on the basis of physico-chemical properties (currently only Henry's law constant) as specified by the relevant modelinfo_[MODEL] file (de-

fault TRUE).

recalc.blood2plasma

Recalculates the ratio of the amount of chemical in the blood to plasma using the input parameters, calculated with hematocrit, Funbound.plasma, and Krbc2pu.

recalc.clearance

Recalculates the the hepatic clearance (Clmetabolism) with new million.cells.per.gliver

parameter.

dosing.matrix Vector of dosing times or a matrix consisting of two columns or rows named

"dose" and "time" containing the time and amount, in mg/kg BW, of each dose.

adjusted.Funbound.plasma

Uses adjusted Funbound.plasma when set to TRUE along with partition coefficients calculated with this value.

regression

Whether or not to use the regressions in calculating partition coefficients.

restrictive.clearance

Protein binding not taken into account (set to 1) in liver clearance if FALSE.

minimum.Funbound.plasma

Monte Carlo draws less than this value are set equal to this value (default is 0.0001 – half the lowest measured Fup in our dataset).

Caco2.options

A list of options to use when working with Caco2 apical to basolateral data Caco2.Pab, default is Caco2.options = list(Caco2.Pab.default = 1.6, Caco2.Fabs = TRUE, Caco2.Fgut = TRUE, overwrite.invivo = FALSE, keepit100 = FALSE). Caco2.Pab.default sets the default value for Caco2.Pab if Caco2.Pab is unavailable. Caco2.Fabs = TRUE uses Caco2.Pab to calculate fabs.oral, otherwise fabs.oral = Fabs. Caco2.Fgut = TRUE uses Caco2.Pab to calculate fgut.oral, otherwise fgut.oral = Fgut. overwrite.invivo = TRUE overwrites Fabs and Fgut in vivo values from literature with Caco2 derived values if available. keepit100 = TRUE overwrites Fabs and Fgut with 1 (i.e. 100 percent) regardless of other settings. See get_fbio for further details.

monitor.vars

Which variables are returned as a function of time. The default value of NULL provides "Cgut", "Cliver", "Cven", "Clung", "Cart", "Crest", "Ckidney", "Cplasma", "Atubules", "Ametabolized", and "AUC"

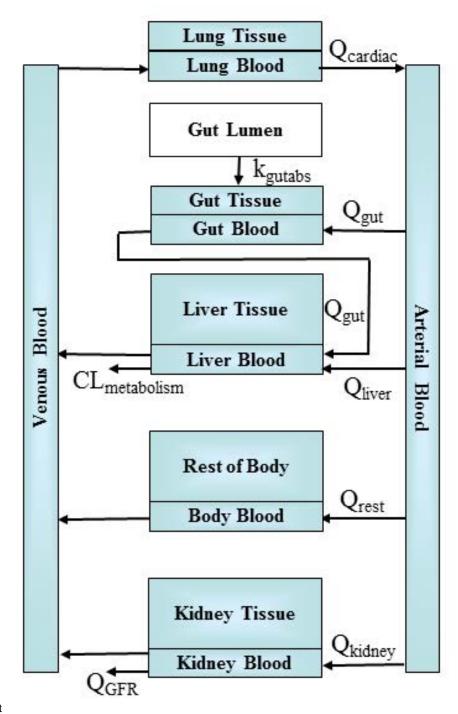

... Additional arguments passed to the integrator (ode).

Details

Note that the model parameters have units of hours while the model output is in days.

Default NULL value for doses.per.day solves for a single dose.

Model Figure

altalt

When species is specified as rabbit, dog, or mouse, the function uses the appropriate physiological data(volumes and flows) but substitutes human fraction unbound, partition coefficients, and intrinsic hepatic clearance.

Because this model does not simulate exhalation, inhalation, and other processes relevant to volatile chemicals, this model is by default restricted to chemicals with a logHenry's Law Constant less than that of Acetone, a known volatile chemical. That is, chemicals with logHLC > -4.5 (Log10 atm-m3/mole) are excluded. Volatility is not purely determined by the Henry's Law Constant, therefore this chemical exclusion may be turned off with the argument "physchem.exclude = FALSE". Similarly, per- and polyfluoroalkyl substances (PFAS) are excluded by default because the transporters that often drive PFAS toxicokinetics are not included in this model. However, PFAS chemicals can be included with the argument "class.exclude = FALSE".

Value

A matrix of class deSolve with a column for time(in days), each compartment, the area under the curve, and plasma concentration and a row for each time point.

Description

This function solves for the amounts or concentrations in uM of a chemical in different tissues as functions of time based on the dose and dosing frequency. In this PBTK formulation. C_{tissue} is the concentration in tissue at time t. Since the perfusion limited partition coefficients describe instantaneous equilibrium between the tissue and the free fraction in plasma, the whole plasma concentration is $C_{tissue,plasma} = \frac{1}{f_{up}*K_{tissue2fup}}*C_{tissue}$. Note that we use a single, constant value of f_{up} across all tissues. Corespondingly the free plasma concentration is modeled as $C_{tissue,freeplasma} = \frac{1}{K_{tissue2fup}}*C_{tissue}$. The amount of blood flowing from tissue x is Q_{tissue} (L/h) at a concentration $C_{x,blood} = \frac{R_{b2p}}{f_{up}*K_{tissue2fup}}*C_{tissue}$, where we use a single R_{b2p} value throughout the body. Metabolic clearance is modelled as being from the total plasma concentration here, though it is restricted to the free fraction in calc_hep_clearance by default. Renal clearance via glomerulsr filtration is from the free plasma concentration. The compartments used in this model are the gutlumen, gut, liver, kidneys, veins, arteries, lungs, and the rest of the body. The extra compartments include the amounts or concentrations metabolized by the liver and excreted by the kidneys through the tubules. AUC is the area under the curve of the plasma concentration.

...
)
```

Arguments

chem. name Either the chemical name, CAS number, or the parameters must be specified.

chem. cas Either the chemical name, CAS number, or the parameters must be specified.

dtxsid EPA's DSSTox Structure ID (https://comptox.epa.gov/dashboard) the chem-

ical must be identified by either CAS name or DTYSIDs

ical must be identified by either CAS, name, or DTXSIDs

times Optional time sequence for specified number of days. Dosing sequence begins

at the beginning of times.

parameters Chemical parameters from parameterize_pbtk function, overrides chem.name

and chem.cas.

days Length of the simulation.

tsteps The number of time steps per hour.

daily.dose Total daily dose, defaults to mg/kg BW.

dose Amount of a single, initial oral dose in mg/kg BW.

doses.per.day Number of doses per day.

initial.values Vector containing the initial concentrations or amounts of the chemical in spec-

ified tissues with units corresponding to output.units. Defaults are zero.

plots Plots all outputs if true.

suppress.messages

Whether or not the output message is suppressed.

species Species desired (either "Rat", "Rabbit", "Dog", "Mouse", or default "Human").

iv.dose Simulates a single i.v. dose if true.

input.units Input units of interest assigned to dosing, defaults to mg/kg BW

output.units A named vector of output units expected for the model results. Default, NULL,

returns model results in units specified in the 'modelinfo' file. See table below

for details.

default.to.human

Substitutes missing animal values with human values if true (hepatic intrinsic clearance or fraction of unbound plasma).

class.exclude Exclude chemical classes identified as outside of domain of applicability by relevant modelinfo_[MODEL] file (default TRUE).

recalc.blood2plasma

Recalculates the ratio of the amount of chemical in the blood to plasma using the input parameters, calculated with hematocrit, Funbound.plasma, and Krbc2pu.

recalc.clearance

Recalculates the the hepatic clearance (Clmetabolism) with new million.cells.per.gliver parameter.

dosing.matrix Vector of dosing times or a matrix consisting of two columns or rows named "dose" and "time" containing the time and amount, in mg/kg BW, of each dose.

adjusted.Funbound.plasma

Uses adjusted Funbound.plasma when set to TRUE along with partition coefficients calculated with this value.

regression Whether or not to use the regressions in calculating partition coefficients. restrictive.clearance

Protein binding not taken into account (set to 1) in liver clearance if FALSE.

minimum.Funbound.plasma

Monte Carlo draws less than this value are set equal to this value (default is 0.0001 – half the lowest measured Fup in our dataset).

Caco2.options A list of options to use when working with Caco2 apical to basolateral data Caco2.Pab, default is Caco2.options = list(Caco2.Pab.default = 1.6, Caco2.Fabs

= TRUE, Caco2.Fgut = TRUE, overwrite.invivo = FALSE, keepit100 = FALSE). Caco2.Pab.default sets the default value for Caco2.Pab if Caco2.Pab is unavailable. Caco2.Fabs = TRUE uses Caco2.Pab to calculate fabs.oral, otherwise fabs.oral = Fabs. Caco2.Fgut = TRUE uses Caco2.Pab to calculate fgut.oral, otherwise fgut.oral = Fgut. overwrite.invivo = TRUE overwrites Fabs and Fgut in vivo values from literature with Caco2 derived values if available. keepit100 = TRUE overwrites Fabs and Fgut with 1 (i.e. 100 percent) regardless of other settings. See get_fbio for further details.

monitor.vars Which variables are returned as a function of time. The default value of NULL provides "Cgut", "Cliver", "Cven", "Clung", "Cart", "Crest", "Ckidney", "Cplasma", "Atubules", "Ametabolized", and "AUC"

time.varying.params

Whether or not to allow parameters to vary in time according to the nonparametric regression determined by get_input_param_timeseries. Default is TRUE.

The age of the individual in months at the beginning of the simulation. Default 360.

ref.pop.dt The output of httkpop_generate containing physiology of the population used in determining timeseries of parameters. Ignored if ref.params is given.

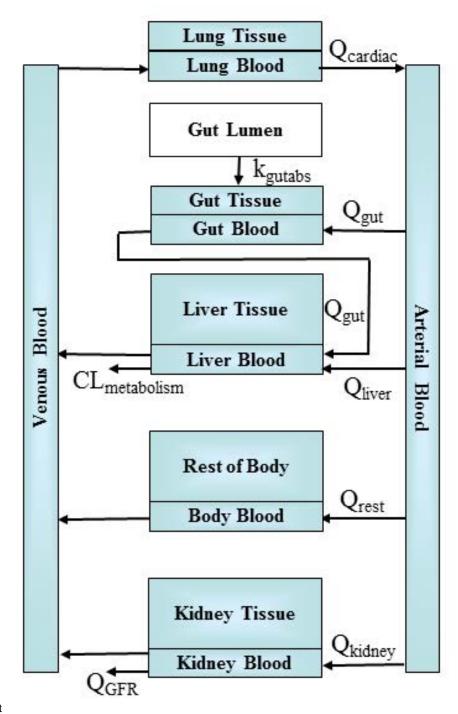

httkpop.generate.arg.list

If ref.pop.dt is NULL, these arguments are used as input to httkpop_generate for generating physiology of a reference population.

| ref.params | Model parameters of a reference population used in determining timeseries Recommended column binding ages in months (as age_months) to the output of create_mc_samples. |
|--------------------|---|
| | Additional arguments passed to the integrator (deSolve). |
| | |
| | |
| Details | |
| | |
| Note that the mode | el parameters have units of hours while the model output is in days. |
| Default NULL val | ue for doses.per.day solves for a single dose. |
| Model Figure | |

377

solve_pbtk_lifestage

altalt

When species is specified as rabbit, dog, or mouse, the function uses the appropriate physiological data(volumes and flows) but substitutes human fraction unbound, partition coefficients, and intrinsic hepatic clearance.

spleen_mass_children 379

Value

A matrix of class deSolve with a column for time(in days), each compartment, the area under the curve, and plasma concentration and a row for each time point.

```

Description

For individuals under 18, predict the spleen mass from height, weight, and gender, using equations from Ogiu et al. (1997)

Usage

```
spleen_mass_children(height, weight, gender)
```

Arguments

height Vector of heights in cm.
weight Vector of weights in kg.

gender Vector of genders (either 'Male' or 'Female').

Value

A vector of spleen masses in kg.

382 thyroid.ac50s

Tables.Rdata.stamp

A timestamp of table creation

Description

The Tables.RData file is separately created as part of building a new release of HTTK. This time stamp indicates the script used to build the file and when it was run.

Usage

Tables.Rdata.stamp

Format

An object of class character of length 1.

Author(s)

John Wambaugh

thyroid.ac50s

ToxCast thyroid-related bioactivity data

Description

Truong et al. 2025 uses ToxCast data for 4 thyroid-related assay endpoints concerning inhibition of deiodinases ("DIO1", "DIO2", "DIO3", and "IYD") and identified 120 priority chemicals with activity for at least one deiodinase. These 120 chemicals were curated after assessment for target selectivity and assay interference.

Usage

thyroid.ac50s

Format

data.table and data.frame

Details

The AC50s (in uM) for each of the 120 chemicals were retrieved from ToxCast invitrodb v3.5 and are used in the "Full Human Gestational IVIVE" vignette.

tissue.data 383

References

tissue.data

Tissue composition and species-specific physiology parameters

Description

This data set contains values from Schmitt (2008) and Ruark et al. (2014) describing the composition of specific tissues and from Birnbaum et al. (1994) describing volumes of and blood flows to those tissues, allowing parameterization of toxicokinetic models for human, mouse, rat, dog, or rabbit. Tissue volumes were calculated by converting the fractional mass of each tissue with its density (both from ICRP), lumping the remaining tissues into the rest-of-body, excluding the mass of the gastrointestinal contents.

Usage

tissue.data

Format

A data.frame containing 406 rows and 5 columns.

| Column | Description |
|-----------|---|
| Tissue | The tissue being described |
| Species | The species being described |
| Reference | The reference for the value reported |
| variable | The aspect of the tissue being characterized |
| value | The value for the variable for the given tissue and species |

Details

Many of the parameters were compiled initially in Table 2 of Schmitt (2009). The full list of tissue variables described is:

| Variable | Description | Units |
|----------|--|----------|
| Fcell | Cellular fraction of total tissue volume | fraction |
| Fint | Interstitial fraction of total tissue volume | fraction |
| FWc | Fraction of cell volume that is water | fraction |
| FLc | Fraction of cell volume that is lipid | fraction |
| FPc | Fraction of cell volume that is protein | fraction |
| Fn_Lc | Fraction of cellular lipid tht is neutral lipid | fraction |
| Fn_PLc | Fraction of cellular lipid tht is neutral phospholipid | fraction |

384 tissue.data

| Fa_PLc | Fraction of cellular lipid tht is acidic phospholipid | fraction |
|---------|---|---------------------|
| pН | Negative logarithm of H+ ion concentration | unitless |
| Density | Tissue density | g/cm^3 |
| Vol | Tissue volume | L/kg |
| Flow | Blood flow to tissue | $mL/min/kg^{(3/4)}$ |

New tissues can be added to this table to generate their partition coefficients.

tissue_masses_flows

Given a data.table describing a virtual population by the NHANES quantities, generates HTTK physiological parameters for each individual.

Description

Given a data.table describing a virtual population by the NHANES quantities, generates HTTK physiological parameters for each individual.

Usage

```
tissue_masses_flows(tmf_dt, add_variability = TRUE)
```

386 tissue_scale

Arguments

tmf_dt A data.table generated by gen_age_height_weight(), containing variables gender, reth, age_months, age_years, weight, and height.

add_variability

An option to add variability to calculated masses and flows. Default is TRUE; use FALSE for repeatable calculations.

Value

The same data.table, with aditional variables describing tissue masses and flows.

wambaugh2019

in vitro Toxicokinetic Data from Wambaugh et al. (2019)

Description

These data are the new HTTK in vitro data for chemicals reported in Wambaugh et al. (2019) They are the processed values used to make the figures in that manuscript. These data summarize the results of Bayesian analysis of the in vitro toxicokinetic experiments conducted by Cyprotex to characterize fraction unbound in the presence of pooled human plasma protein and the intrnsic hepatic clearance of the chemical by pooled human hepatocytes.

Usage

wambaugh2019

Format

A data frame with 496 rows and 17 variables:

Compound The name of the chemical

CAS The Chemical Abstracts Service Registry Number

Human.Clint Median of Bayesian credible interval for intrinsic hepatic clearance (uL/min/million hepatocytes)]

Human.Clint.pValue Probability that there is no clearance

Human.Funbound.plasma Median of Bayesian credibl interval for fraction of chemical free in the presence of plasma

pKa_Accept pH(s) at which hydrogen acceptor sites (if any) are at equilibrium

pKa_Donor pH(s) at which hydrogne donor sites (if any) are at equilibrium

NHANES Chemical Intake Rates for chemicals in Wambaugh et al. (2019)

Description

These data are a subset of the Bayesian inferrences reported by Ring et al. (2017) from the U.S. Centers for Disease Control and Prevention (CDC) National Health and Nutrition Examination Survey (NHANES). They reflect the populaton median intake rate (mg/kg body weight/day), with uncertainty.

Usage

wambaugh2019.nhanes

Format

A data frame with 20 rows and 4 variables:

IP The median of the Bayesian credible interval for median population intake rate (mg/kg bodyweight/day)

IP.min The lower 95th percentile of the Bayesian credible interval for median population intake rate (mg/kg bodyweight/day)

IP.max The upper 95th percentile of the Bayesian credible interval for median population intake rate (mg/kg bodyweight/day)

wambaugh2019.raw

Raw Bayesian in vitro Toxicokinetic Data Analysis from Wambaugh et al. (2019)

Description

These data are the new HTTK in vitro data for chemicals reported in Wambaugh et al. (2019) They are the output of different Bayesian models evaluated to compare using a single protein concentration vs. the new three concentration titration protocol. These data summarize the results of Bayesian analysis of the in vitro toxicokinetic experiments conducted by Cyprotex to characterize fraction unbound in the presence of pooled human plasma protein and the intrnsic hepatic clearance of the chemical by pooled human hepatocytes. This file includes replicates (different Compound-Name id's but same chemical')

Usage

wambaugh2019.raw

Format

A data frame with 530 rows and 28 variables:

DTXSID Identifier for CompTox Chemical Dashboard

Name The name of the chemical

CompoundName Sample name provided by EPA to Cyprotex

Fup.point Point estimate of the fraction of chemical free in the presence of plasma

Base.Fup.Med Median of Bayesian credible interval for fraction of chemical free in the presence of plasma for analysis of 100 physiological plasma protein data only (base model)

Base.Fup.Low Lower 95th percentile of Bayesian credible interval for fraction of chemical free in the presence of plasma for analysis of 100 physiological plasma protein data only (base model)

Base.Fup.High Upper 95th percentile of Bayesian credible interval for fraction of chemical free in the presence of plasma for analysis of 100 physiological plasma protein data only (base model)

Affinity.Fup.Med Median of Bayesian credible interval for fraction of chemical free in the presence of plasma for analysis of protein titration protocol data (affinity model)

wambaugh2019.raw 391

Affinity.Fup.Low Lower 95th percentile of Bayesian credible interval for fraction of chemical free in the presence of plasma for analysis of protein titration protocol data (affinity model)

- **Affinity.Fup.High** Upper 95th percentile of Bayesian credible interval for fraction of chemical free in the presence of plasma for analysis of protein titration protocol data (affinity model)
- **Affinity.Kd.Med** Median of Bayesian credible interval for protein binding affinity from analysis of protein titration protocol data (affinity model)
- **Affinity.Kd.Low** Lower 95th percentile of Bayesian credible interval for protein binding affinity from analysis of protein titration protocol data (affinity model)
- **Affinity.Kd.High** Upper 95th percentile of Bayesian credible interval for protein binding affinity from analysis of protein titration protocol data (affinity model)
- **Decreases.Prob** Probability that the chemical concentration decreased systematically during hepatic clearance assay.
- **Saturates.Prob** Probability that the rate of chemical concentration decrease varied between the 1 and 10 uM hepatic clearance experiments.
- **Slope.1uM.Median** Estimated slope for chemcial concentration decrease in the 1 uM hepatic clearance assay.
- **Slope.10uM.Median** Estimated slope for chemcial concentration decrease in the 10 uM hepatic clearance assay.
- **CLint.1uM.Median** Median of Bayesian credible interval for intrinsic hepatic clearance at 1 uM initial chemical concentration (uL/min/million hepatocytes)]
- **CLint.1uM.Low95th** Lower 95th percentile of Bayesian credible interval for intrinsic hepatic clearance at 1 uM initial chemical concentration (uL/min/million hepatocytes)
- **CLint.1uM.High95th** Uppper 95th percentile of Bayesian credible interval for intrinsic hepatic clearance at 1 uM initial chemical concentration(uL/min/million hepatocytes)
- **CLint.10uM.Median** Median of Bayesian credible interval for intrinsic hepatic clearance at 10 uM initial chemical concentration (uL/min/million hepatocytes)]
- **CLint.10uM.Low95th** Lower 95th percentile of Bayesian credible interval for intrinsic hepatic clearance at 10 uM initial chemical concentration (uL/min/million hepatocytes)
- **CLint.10uM.High95th** Uppper 95th percentile of Bayesian credible interval for intrinsic hepatic clearance at 10 uM initial chemical concentration(uL/min/million hepatocytes)
- **CLint.1uM.Point** Point estimate of intrinsic hepatic clearance (uL/min/million hepatocytes) for 1 uM initial chemical concentration
- **CLint.10uM.Point** Point estimate of intrinsic hepatic clearance (uL/min/million hepatocytes) for 10 uM initial chemical concentration
- Fit Classification of clearance observed

wambaugh2019.seem3

ExpoCast SEEM3 Consensus Exposure Model Predictions for Chemical Intake Rates

Description

These data are a subset of the Bayesian inferrences reported by Ring et al. (2019) for a consensus model of twelve exposue predictors. The predictors were calibrated based upon their ability to predict intake rates inferred National Health and Nutrition Examination Survey (NHANES). They reflect the populaton median intake rate (mg/kg body weight/day), with uncertainty.

Usage

wambaugh2019.seem3

Format

A data frame with 385 rows and 38 variables:

wambaugh2019.tox21 393

wambaugh2019.tox21

Tox21 2015 Active Hit Calls (EPA)

Description

The ToxCast and Tox21 research programs employ batteries of high-throughput assays to assess chemical bioactivity in vitro. Not every chemical is tested through every assay. Most assays are conducted in concentration response, and each corresponding assay endpoint is analyzed statistically to determine if there is a concentration-dependent response or "hit" using the ToxCast Pipeline. Most assay endpoint-chemical combinations are non-responsive. Here, only the hits are treated as potential indicators of bioactivity. This bioactivity does not have a direct toxicological interpretation. The October 2015 release (invitrodb_v2) of the ToxCast and Tox21 data were used for this analysis. This object contains just the chemicals in Wambaugh et al. (2019) and only the quantiles across all assays for the ACC.

Usage

wambaugh2019.tox21

Format

A data.table with 401 rows and 6 columns

wf1

WHO weight-for-length charts

Description

Charts giving weight-for-length percentiles for boys and girls under age 2.

Usage

wf1

Format

a data.table with 262 rows and 4 variables:

Sex "Male" or "Female"

Length Recumbent length in cm

P2.3 The 2.3rd percentile weight in kg for the corresponding sex and recumbent length

P97.7 The 97.7th percentile weight in kg for the corresponding sex and recumbent length

Details

For infants under age 2, weight class depends on weight for length percentile. #'

Underweight <2.3rd percentile

Normal weight 2.3rd-97.7th percentile

Obese >=97.7th percentile
