

Package ‘translate.logit’

July 22, 2025

Type Package

Title Translation of Logit Regression Coefficients into Percentages

Version 1.0

Imports nleqslv, nnet

Description Translation of logit models coefficients into percentages, following Deauvieu (2010) <[doi:10.1177/0759106309352586](https://doi.org/10.1177/0759106309352586)>.

Music	1
translate.logit	2
Index	5

Music	<i>Music (data)</i>
-------	---------------------

Description

The data concerns tastes for music of a set of 500 individuals. It contains 5 variables of likes for music genres (french pop, rap, rock, jazz and classical), 2 about music listening and 2 additional variables (gender and age).

Usage

```
data(Music)
```

Format

A data frame with 500 observations and the following 7 variables:

FrenchPop is a factor with levels No, Yes, NA

Rap is a factor with levels No, Yes, NA

Rock is a factor with levels No, Yes, NA

Jazz is a factor with levels No, Yes, NA

Classical is a factor with levels No, Yes, NA

Gender is a factor with levels Men, Women

Age is a factor with levels 15-24, 25-49, 50+

OnlyMus is a factor with levels Daily, Often, Rare, Never, indicating how often one only listens to music.

Daily is a factor with levels No, Yes indicating if one listens to music every day.

Details

'NA' stands for 'not available'

Examples

```
data(Music)
str(Music)
```

translate.logit	<i>Translates logit regression coefficients into percentages</i>
-----------------	--

Description

Performs a logit regression and then computes the effects of covariates expressed in percentages (through two methods: 'pure' effects and 'experimental' effects; see Deauvieu, 2010)

Usage

```
translate.logit(formula,data,nit=0)
```

Arguments

formula	an object of class formula (or one that can be coerced to that class): a symbolic description of the model to be fitted.
data	a data frame containing the variables in the model. Every variables have to be factors.
nit	number of bootstrap iterations for confidence interval computation. Default is 0, i.e. no confidence interval is computed.

Details

This function works with binomial as well as multinomial regression models. If the dependent variable has two factors, `glm` is used ; if it has more than two factors `multinom` function (from `nnet` package) is used.

The function expresses the regression coefficients as percentages through three distinct methods: raw percentages, 'pure effects' percentages and 'experimental effects' percentages (see DeaUVieau, 2010).

Bootstrap confidence interval are available only for binomial regressions.

Value

The function returns a list:

<code>glm</code>	An object of class <code>glm</code> or <code>nnet</code> (depending on the number of factors of the dependent variable)
<code>summary</code>	The results of <code>summary</code> function applied to <code>reg</code> element
<code>percents</code>	A matrix or a list of matrices (depending on the number of factors of the dependent variable) with regression coefficients expressed as percentages
<code>boot.ci</code>	A matrix or a list of matrices (depending on the number of factors of the dependent variable) with confidence intervals computed with bootstrap
